REVISION HISTORY

HARDWARE	
2010/08/23	<p>Hardware version: v1.1 (See PCN 10284. Version number has not changed.</p> <p>Since last hardware revision:</p> <ul style="list-style-type: none">● The OLED panel was reduced from “65 mm x 23.5 mm” to “63.3 mm x 20.8 mm”.● A carrier was added to bring the module overall dimensions to “65.00 mm x 23.5 mm”. See the carrier in Module Outline Drawings (Pg. 11).● Improvements in the organic material increased efficiency.<ul style="list-style-type: none">- The typical driving voltage changed from “+14v” to “+12v”.- The typical brightness (luminosity) increased from “80 cd/m²” to “100 cd/m²”.- For the CFAL12822A series, lifetime increased from “10,000 hours” to “20,000 hours” at 50% brightness.● The shape but not length or pitch of the FFC tail changed.
2008/10/01	<p>Hardware version: v1.1 Factory location changed. The module has not changed.</p>
2009/04/27	<p>Hardware version: vA New module.</p>

DATA SHEET	
2011/01/13	<p>Current Data Sheet version: v2.1</p> <p>Since last Data Sheet (v2.0), the following Data Sheet changes were made:</p> <ul style="list-style-type: none">● Wherever listed, including in the hardware revision information for 2010/08/23 listed above, corrected carrier width from “64.80” to “65.00” mm. Physical module has not changed.● In Details of Interface Pin Function (Pg. 18),<ul style="list-style-type: none">- Pin 10 description, deleted “<i>SPI (serial) mode: Pin acts as SA0 for slave address selection.</i>” This information was not correct.- Pin 16 description, added note “<i>When using SPI interface, DB2 should be left open. DB3-DB7 should be tied to GND (low).</i>”

DATA SHEET (Continued)	
2010/09/17	<p>Data Sheet version: v2.0 Since last Data Sheet (v1.1), the following Data Sheet changes are based on the improved hardware version v1.1. See PCN 10284.</p> <ul style="list-style-type: none">● Wherever listed, changed<ul style="list-style-type: none">- Dimension for overall module width with FFC unfolded from "65.00" to "64.80" millimeters.- Depth dimension from "2.25" to "2.45" millimeters maximum. This is a correction. Module has not changed.- Bend radius from ">R 1.28 mm" to ">5.00 mm".● In Physical Characteristics, added Mechanical Vibration specifications.● Revised Module Outline Drawings to include new carrier board.● In Absolute Maximum Ratings changed Driver Supply Voltage<ul style="list-style-type: none">- <i>Minimum</i> from "+12v" to "+11.5v".- <i>Maximum</i> from "+16v" to "+12.5v".● In DC Characteristics, changed OLED Driver Supply Voltage<ul style="list-style-type: none">- <i>Minimum</i> from "+12v" to "+11.5v".- <i>Typical</i> from "+14v" to "+12v".- <i>Maximum</i> from "+16v" to "+12.5v".● In Optical Characteristics, improved typical Luminous Intensity from "80 cd/m²" to "100 cd/m²".● In Module Reliability,<ul style="list-style-type: none">- Increased lifetime estimate from "10,000 hours >50% of initial brightness at typical brightness for a new module" to "Brightness will be >50% of a new module's initial brightness for at least 20,000 hours of operation."- Added description of test conditions for lifetime specification.● Minor change was made in the APPENDIX B: SAMPLE CODE.● Added more terms to APPENDIX C: OLED MODULE TERMS AND SYMBOLS.● Throughout Data Sheet, made minor text, format, and illustration changes to improve understanding.● After the Data Sheet, added <i>CFA10009 User Guide</i> for the optional CrystalFontz CFA-10009 Demonstration PCB.
2009/12/21	<p>Data Sheet version: v1.1 Since last Data Sheet (v1.0):</p> <ul style="list-style-type: none">● Wherever listed, corrected specification of overall module depth in inches. Module dimensions did not change.<ul style="list-style-type: none">- Changed maximum from "0.89" to "0.09" inches.- Changed nominal from "0.85" to "0.08" inches.● Fixed broken cross-reference for Absolute Maximum Ratings.● Corrected mention of "TFT" to "OLED" in APPENDIX C: OLED MODULE TERMS AND SYMBOLS.

DATA SHEET (Continued)	
2009/11/12	<p>Data Sheet version: v1.0 Since last Data Sheet (no version number, unmarked Preliminary):</p> <ul style="list-style-type: none">● Moved specifications into standard Graphic OLED template.● In Physical Characteristics (previously “General Specifications”):<ul style="list-style-type: none">- Corrected “Viewing Area” <i>height</i> from “13.7” to “13.85” millimeters. Viewing Area is unchanged and was correct in the 2009/04/13 Contour Drawing of the Preliminary version.- Changed “Module Dimension” <i>height</i> from “23.5” millimeters (which is OLED panel height) to “33.52” (OLED panel with FFC fold) and “59.50” (OLED panel with FFC unfolded).- Expanded “Module Dimension” <i>depth</i> description from “2.15” to <i>nominal depth</i> “2.15” and <i>maximum depth</i> “2.25” millimeters.- Added specifications for “Diagonal”, “FFC Bend Radius”, “Module Connector Pitch”, and “Weight”.● Deleted “Contour Drawing” date 2008/12/29 on page 7. This was an outdated duplicate of a second Contour Drawing date 2009/04/13 on page 8. Descriptions in second Contour Drawing were updated. No dimensions changed. See Module Outline Drawings.● In Absolute Maximum Ratings:<ul style="list-style-type: none">- Changed V_{LOGIC} (Logic Supply Voltage) minimum from “-0.3v” to “2.4v”.- Added V_{PANEL} (Driver Supply Voltage) and Humidity specifications.● Expanded “Precautions in use of OLED Modules” with important information on design, hot bar soldering, and cleaning. See CARE AND HANDLING PRECAUTIONS.

DATA SHEET (Continued)	
2009/11/12	<ul style="list-style-type: none"> ● Clarified and expanded electrical characteristics. See DC Characteristics. Slight change in V_{IH} specification from “+2.4v” to “+2.64v”. ● In Details of Interface Pin Function, used CrystalFontz standard terms for signals and improved descriptions. ● Improved illustrations include adding: <ul style="list-style-type: none"> - More details in System Block Diagram. - Circuit example using Micrel MIC2290 for V_{PANEL} (see Circuit Example – Externally Supplied for Display). - Illustration to explain Power Up and Power Down Sequencing. - Photo with pins labeled (see Photo Reference for ZIF Connector Pin Functions). - Definition of Viewing Angle in Optical Characteristics. ● Also added these new sections: <ul style="list-style-type: none"> - MAIN FEATURES. - ESD (Electro-Static Discharge). - MODULE RELIABILITY AND LONGEVITY. - APPENDIX A: QUALITY ASSURANCE STANDARDS. - APPENDIX B: SAMPLE CODE - APPENDIX C: OLED MODULE TERMS AND SYMBOLS. - APPENDIX D: SOLOMON SYSTECH SSD1305 CONTROLLER SPECIFICATION SHEET. ● Deleted information that is repeated in the appended controller specifications. ● This module can be ordered as part of a CFA10009 demonstration board kit. The <i>CFA10009 User Guide</i> was added at the end of this Data Sheet.
2009/04/27	Data Sheet version: No version number (unmarked Preliminary) New Data Sheet.

The Fine Print

Certain applications using CrystalFontz America, Inc. products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications"). CRYSTALFONTZ AMERICA, INC. PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. Inclusion of CrystalFontz America, Inc. products in such applications is understood to be fully at the risk of the customer. In order to minimize risks associated with customer applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazard. Please contact us if you have any questions concerning potential risk applications.

CrystalFontz America, Inc. assumes no liability for applications assistance, customer product design, software performance, or infringements of patents or services described herein. Nor does CrystalFontz America, Inc. warrant or represent that any license, either express or implied, is granted under any patent right, copyright, or other intellectual property right of CrystalFontz America, Inc. covering or relating to any combination, machine, or process in which our products or services might be or are used.

MAIN FEATURES

DEMONSTRATION AND EVALUATION PLATFORM

This module is available installed on a Crystalfontz CFA-10009 Demonstration PCB. The [DMO-L12822AYB1](#) kit has everything you need to easily demonstrate and experiment with the module. The kit can also be used as a reference for your designs.

COMPARISON TO LCD (LIQUID CRYSTAL DISPLAY) MODULE

The CFAL12822A-Y-B1 is a 128 x 22 dot matrix Organic Light-Emitting Diode (OLED) display module. The small size and ultrathin form factor of the CFAL12822A-Y-B1 makes it possible to use this OLED module in applications where it would be difficult or impossible to fit a traditional monochrome LCD module. Because of the low power requirements, the CFAL12822A-Y-B1 is suitable in battery powered portable devices such as remote controls and scientific meters (for example, temperature, sound, and gas detection).

Compared to most LCD modules, this OLED module has a quicker response time and an extremely wide viewing angle. At the low end of an STN LCD's temperature range, a module's contrast will typically be poor and the response time will be very slow. Unlike an STN LCD module, contrast does not diminish and response time is good at the lower end of an OLED module's operating temperature range, allowing it to operate in cold environments without a heater.

FEATURES

- 128 x 22 module consists of an OLED panel, a COG (Chip On Glass) driver IC, and an FFC (Flat Flexible Cable) that mates with a ZIF connector.
- Module Dimensions
 - Active Area is 2.36" diagonal, 58.85 (W) x 11.85 (H) millimeters (2.32" (W) x 0.47" (H)).
 - Overall module dimension with FFC unfolded is 65 (W) x 59.50 (H) x 2.45 maximum (D) mm (2.55" (W) x 2.34" (H) x 0.10" maximum (D)).
 - Overall module dimension without FFC is 65 (W) x 23.50 (H) x 2.45 maximum (D) mm (2.55" (W) x 0.93" (H) x 0.10" maximum (D)).
- Requires 3v for logic and a separate supply for V_{PANEL} .
- 8-bit parallel (8080 or 6800) interface or SPI Interface.
- Built-in Solomon Systech [SSD1305](#) or compatible controller.
- Emissive monochrome display. Displays yellow pixels on dark area or dark pixels on yellow area (if operating with display pixels reversed/inverted).
- CFAL12822A-Y-B1 mates with standard 0.5 mm 24-pin ZIF sockets such as [OR721CT-ND](#), [OR709CT-ND](#), and [OR877CT-ND](#) available from Digi-Key.
- Very high contrast ratio.
- Extremely wide viewing angle is $>160^\circ$.
- Wide temperature operation is -20°C to $+70^\circ\text{C}$.
- RoHS compliant.

MODULE CLASSIFICATION INFORMATION

CFA L 128 22 A - Y - B1
 ① ② ③ ④ ⑤ ⑥ ⑦

①	Brand	CrystalFontz America, Inc.
②	Display Type	L – OLED
③	Number of Pixels (Width)	128 pixels
④	Number of Pixels (Height)	22 pixels
⑤	Model Identifier	A
⑥	Display Color	Y – Yellow
⑦	Special Code	B1 – Manufacturer's code

MECHANICAL SPECIFICATIONS

PHYSICAL CHARACTERISTICS

Number of Pixels		
128 x 22 pixels = 2,816 pixels		
Pixel Detail	Width	Height
Pixel Size	0.43 mm	0.51 mm
Pixel Pitch	0.46 mm	0.54 mm

Module Depth		
	Maximum	Nominal
Millimeters	2.45	2.15
Inches	0.10"	0.08"

Viewing Area		
	Width	Height
Millimeters	60.85	13.85
Inches	2.40"	0.55"

Active Area		
Diagonal	Inches: 2.36"	
	Width	Height
Millimeters	58.85	11.85
Inches	2.32"	0.47"

Module Overall with FFC Unfolded		
	Width	Height
Millimeters	65.00	59.50
Inches	2.55"	2.34"

Module Overall without FFC (Carrier)		
	Width	Height
Millimeters	65.00	23.50
Inches	2.55"	0.93"

Other Physical Characteristics	
Module Connector Pitch	Standard 0.5mm 24-pin ZIF socket <i>The module's FFC mates with standard 0.5 mm 24-pin ZIF sockets such as OR721CT-ND, OR709CT-ND, and OR877CT-ND available from Digi-Key.</i>
FFC Bend Radius	>R5.00 mm
Weight	5 grams (typical)
Mechanical Vibration	Samples passed test with these conditions: Frequency: 5~50Hz,0.5G Scan rate: 1 octave per minute Time: 2 hours each axis Axis: X,Y, Z <i>The effect of vibrations or shock depends on how you mount the module. Test your completed product to ensure it meets your vibration and shock requirements. The specifications above are for a module that is not mounted.</i>

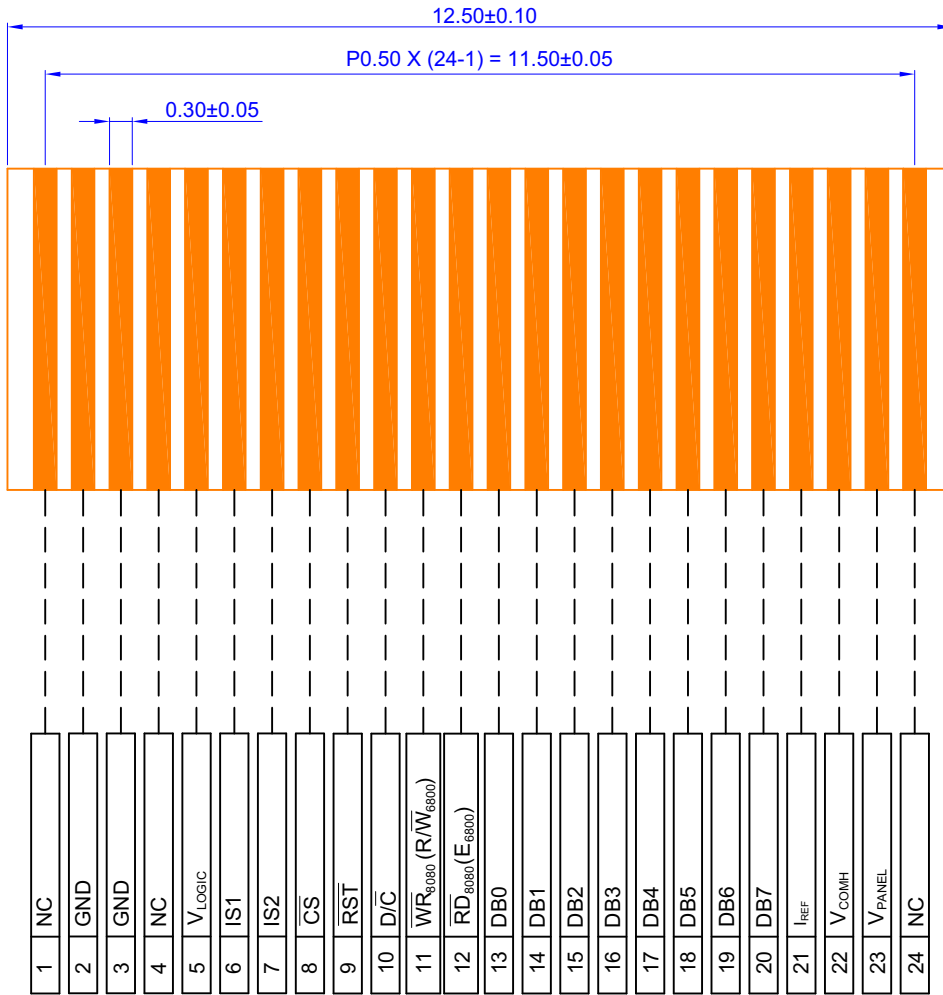

MODULE OUTLINE DRAWINGS

CIRCUIT EXAMPLE – EXTERNALLY SUPPLIED FOR DISPLAY

The [Micrel MIC2290](#) is one of many possible V_{PANEL} supply solutions.

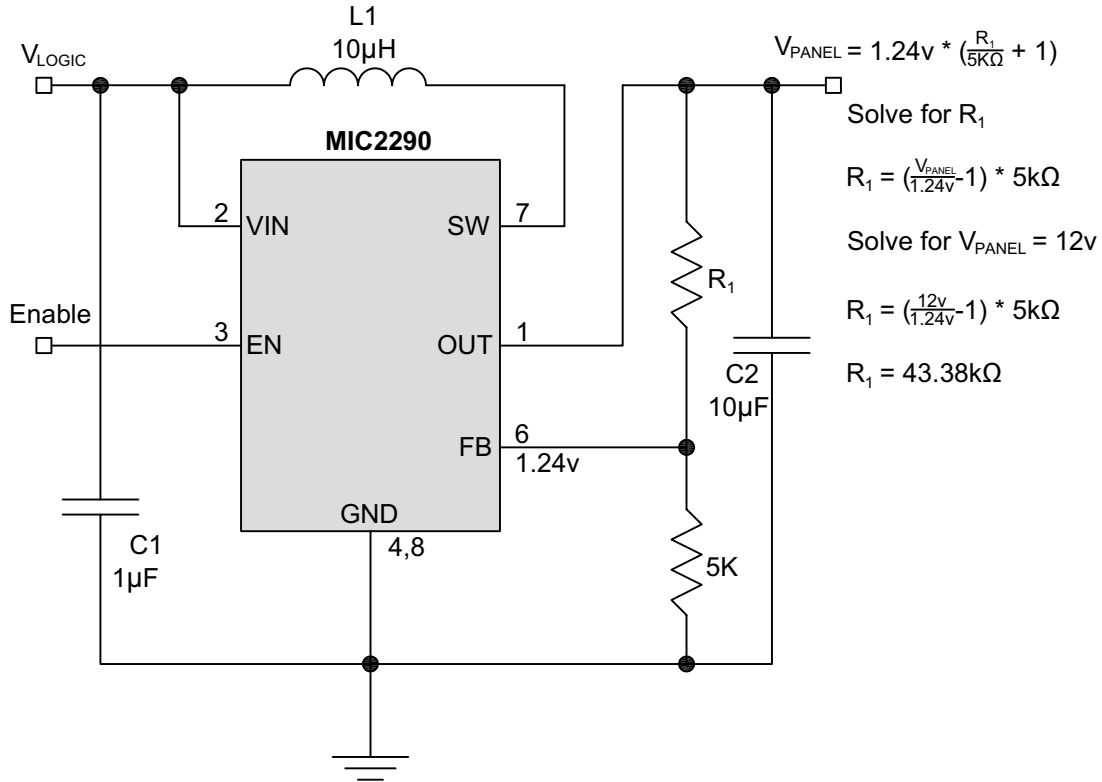

Figure 3. Circuit Example – External Supply for Display

Please refer to the Micrel MIC2290 datasheet for design details. See <http://micrel.com/page.do?page=/product-info/products/mic2290.shtml>.

POWER UP AND POWER DOWN SEQUENCING

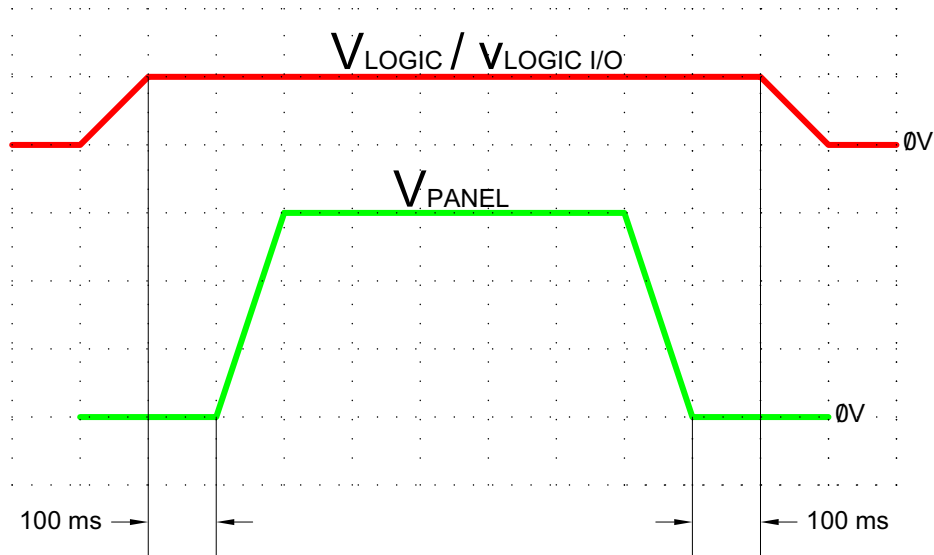

Figure 4. Power Up and Power Down Sequencing

ABSOLUTE MAXIMUM RATINGS

ABSOLUTE MAXIMUM RATINGS	SYMBOL	MINIMUM	MAXIMUM
Operating Temperature*	T_{OP}	-20°C	+70°C
Storage Temperature*	T_{ST}	-30°C	+80°C
Humidity (Noncondensing)	RH	0%	90%
Logic Supply Voltage	V_{LOGIC}	+2.4v	+3.5v
Driver Supply Voltage	V_{PANEL}	+11.5v	+12.5v
*Prolonged exposure at temperatures outside of this range may cause permanent damage to the module or decrease product lifetime.			

DC CHARACTERISTICS

DC CHARACTERISTICS	TEST CONDITION	SYMBOL	MINIMUM	TYPICAL	MAXIMUM
Logic Supply Voltage	$T_{OP} = -20^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	V_{LOGIC}	+2.4v	+3.0v	+3.5v ¹
OLED Driver Supply Voltage ²	$T_{OP} = -20^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	V_{PANEL}	+11.5v	+12v	+12.5v
Input High Voltage		V_{IH}	$+0.8v \times V_{Logic}$ For $V_{Logic} = +3.3v$ $V_{IH} = +0.8v \times +3.3v = +2.64v$		V_{Logic}
Input Low Voltage		V_{IL}	0v (GND)		$+0.2v \times V_{Logic}$ For $V_{Logic} = +3.3v$ $V_{IL} = +0.2v \times +3.3v = +0.66v$
Output High Voltage	$I_{OUT} = 100\mu\text{A}$ 3.3MHz	V_{OH}	$+0.9v \times V_{Logic}$ For $V_{Logic} = +3.3v$ $V_{OH} = +0.9v \times +3.3v = +2.97v$		V_{Logic}
Output Low Voltage	$I_{OUT} = 100\mu\text{A}$ 3.3MHz	V_{OL}	0v (GND)		$+0.1v \times V_{Logic}$ For $V_{Logic} = +3.3v$ $V_{OL} = +0.1v \times +3.3v = +0.33v$
Total Power	All pixels on $V_{LOGIC} = +3.0v$ $V_{PANEL} = +14.0v$ 80 cd/m ² $T_{OP} = 25^{\circ}\text{C}$	P_T		154 mW	300 mW

¹Do not exceed +3.5v maximum.

²The V_{PANEL} input must be a stable value with no ripple or noise.

This is a summary of the module's major operating parameters. For detailed information see [APPENDIX D: SOLOMON SYS-TECH SSD1305 CONTROLLER SPECIFICATION SHEET \(Pg. 37\)](#).

DETAILS OF INTERFACE PIN FUNCTION

PIN	SIGNAL	LEVEL	DIRECTION	DESCRIPTION															
1	NC			No Connection															
2	GND	0v		Ground. Must be connected to an external ground.															
3	GND	0v		Ground. Must be connected to an external ground.															
4	NC			No Connection															
5	V _{LOGIC}	+2.4v to +3.5v		Power supply input. Must be connected to an external source.															
6	IS1	H/L	I	<table border="1"> <thead> <tr> <th>IS1</th> <th>IS2</th> <th>Interface Mode</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>SPI (Serial)</td> </tr> <tr> <td>0</td> <td>1</td> <td>6800 Parallel</td> </tr> <tr> <td>1</td> <td>0</td> <td>Not Allowed</td> </tr> <tr> <td>1</td> <td>1</td> <td>8080 Parallel</td> </tr> </tbody> </table>	IS1	IS2	Interface Mode	0	0	SPI (Serial)	0	1	6800 Parallel	1	0	Not Allowed	1	1	8080 Parallel

0	0	SPI (Serial)																	
0	1	6800 Parallel																	
1	0	Not Allowed																	
1	1	8080 Parallel																	
7	IS2	H/L	I																
8	$\overline{\text{CS}}$	H/L	I	<p>Chip select input.</p> <p><i>Low:</i> Controller chip is selected. Communications with the host MPU is possible.</p> <p><i>High:</i> Controller chip is not selected. MPU interface signals are ignored by the controller.</p>															
9	$\overline{\text{RST}}$	L	I	<p>Reset signal.</p> <p><i>Low:</i> Display controller is reset. The $\overline{\text{RST}}$ pin should be pulsed low shortly after power is applied.</p> <p><i>High:</i> The $\overline{\text{RST}}$ pin should be brought high for normal operation.</p>															
10	D/ $\overline{\text{C}}$	H/L	I	<p>Data/Command control. Determines whether data bits are data or command.</p> <p>1 – <i>High:</i> Addresses the data register. 2 – <i>Low:</i> Addresses the command register.</p>															

PIN	SIGNAL	LEVEL	DIRECTION	DESCRIPTION
11	\overline{WR}_{8080} (R/\overline{W}_{6800})	H/L	I	Host interface input. <i>8080 Host:</i> Active low. Signal on the data bus is latched at the rising edge of \overline{WR} signal. <i>6800 Host:</i> read/write control signal output. $R/\overline{W} = High$: Read (Host←Module) $R/\overline{W} = Low$: Write (Host→Module) <i>SPI (serial) mode:</i> Connect to ground.
12	\overline{RD}_{8080} (E_{6800})	H/L	I	Host interface input. <i>8080 Host:</i> Active low. Signal on the data bus is latched at the rising edge of \overline{WR} signal. <i>6800 Host:</i> Enable control signal input active high. $E = High$: Read or Write Active $E = Low$: No Read or Write Active <i>SPI (serial) mode:</i> Connect to ground.
13	DB0	H/L	I/O	Bidirectional data bus connects to 8-bit standard host data bus. <i>In serial mode (IS1=0, IS2=0):</i> DB0 serves as the serial clock input signal (SCL) and DB1 serves as the serial data input pin (SI). DB2-DB7 are high impedance. In serial mode, data can be written to the display but not read. Pin 11 (\overline{WR}_{8080} (R/\overline{W}_{6800})) and pin12 (\overline{RD}_{8080} (E_{6800})) are unused and should be tied low. When using <i>SPI interface</i> , DB2 should be left open. DB3-DB7 should be tied to GND (low). <i>In 6800 Parallel mode:</i> Pin 11 is used as R/\overline{W}_{6800} . Pin 12 is used as E_{6800} . Data is input or output on DB0-DB7. <i>In 8080 Parallel mode:</i> Pin 11 is used as \overline{WR}_{8080} . Pin 12 is used as \overline{RD}_{8080} . Data is input or output on DB0-DB7.
14	DB1	H/L	I/O	
15	DB2	H/L	I/O	
16	DB3	H/L	I/O	
17	DB4	H/L	I/O	
18	DB5	H/L	I/O	
19	DB6	H/L	I/O	
20	DB7	H/L	I/O	
21	I_{REF}		O	Segment output current reference for brightness adjustment. A resistor should be connected between this pin and GND. Set the current at 10 μ A.
22	V_{COMH}		O	High level voltage output for common signals. A low ESR capacitor should be connected between this pin and GND. Do not connect external power supply directly to this pin.

PIN	SIGNAL	LEVEL	DIRECTION	DESCRIPTION
23	V _{PANEL}	+11.5v to +12.5v	I	<p>Driver supply voltage. Only high voltage input on chip. Power must be supplied externally.</p> <p><i>Note: You must observe power sequencing for this pin.</i></p> <p><i>Power Up</i> – Display must be powered up and initialized before power is applied to the pin.</p> <p><i>Power Down</i> – Power must be removed from this pin before the display is powered off.</p>
24	NC			No connection

PHOTO REFERENCE FOR ZIF CONNECTOR PIN FUNCTIONS

Figure 5. Back View of ZIF Connector Pins (Labeled)

ESD (ELECTRO-STATIC DISCHARGE)

The circuitry is industry standard CMOS logic and susceptible to ESD damage. Please use industry standard antistatic precautions as you would for any other static sensitive devices such as expansion cards, motherboards, or integrated circuits. Ground your body, work surfaces, and equipment.

OPTICAL SPECIFICATIONS

OPTICAL CHARACTERISTICS

ITEM	SYMBOL	TEST CONDITION	MINIMUM	TYPICAL	MAXIMUM
Viewing Angle				>160°	
Dark Room Contrast Ratio ¹	CR	80 cd/m ²		>100:1	
Response Time ²				<1 ms	
Luminous Intensity (IV)	L _{BR}	with polarizer		100 cd/m ²	
Duty					1/64

¹Contrast Ratio = (brightness with pixels light)/(brightness with pixels dark).
²Response Time: The amount of time it takes a pixel to change from active to inactive or back again.

Definition of Viewing Angle

Figure 6. CFAL12822A-Y-B1 has a 160° Viewing Angle

OLED CONTROLLER INTERFACE

This module uses a Solomon Systech SSD1305 or compatible controller. For your reference, we added [APPENDIX D: SOLOMON SYSTECH SSD1305 CONTROLLER SPECIFICATION SHEET \(Pg. 37\)](#) to this Data Sheet.

MODULE RELIABILITY AND LONGEVITY

MODULE RELIABILITY

ITEM	SPECIFICATION
CFAL12822A-Y-B1	Brightness will be >50% of a new module's initial brightness for at least 20,000 hours of operation.
<i>Test Conditions:</i> <input type="checkbox"/> Accelerated test: 240 hours at 80°C operating temperature, 80 cd/m ² . <input type="checkbox"/> Test pattern is 50% alternating checkerboard. <i>Under operating and storage temperature specification limitations, humidity RH 65%, and no exposure to direct sunlight.</i>	

OLED displays are an emissive technology. Each pixel is susceptible to dimming based on its individual use (burn-in). Frequently used pixels will dim more quickly than pixels that are not used as often. Please avoid using a bright, static, high-contrast image for a long time. If you want to leave the display powered on, please use scrolling text or alternating images to "wear level" the pixels. To conserve power and display lifetime, turn off or dim the display when it is not in use.

MODULE LONGEVITY (EOL / REPLACEMENT POLICY)

Crystalfontz is committed to making all of our modules available for as long as possible. For each module we introduce, we intend to offer it indefinitely. We do not preplan a module's obsolescence. The majority of modules we have introduced are still available.

We recognize that discontinuing a module may cause problems for some customers. However, rapidly changing technologies, component availability, or low customer order levels may force us to discontinue ("End of Life", EOL) a module. For example, we must occasionally discontinue a module when a supplier discontinues a component or a manufacturing process becomes obsolete. When we discontinue a module, we will do our best to find an acceptable replacement module with the same fit, form, and function.

In most situations, you will not notice a difference when comparing a "fit, form, and function" replacement module to the discontinued module. However, sometimes a change in component or process for the replacement module results in a slight variation, perhaps an improvement, over the previous design.

Although the replacement module is still within the stated Data Sheet specifications and tolerances of the discontinued module, changes may require modification to your circuit and/or firmware. Possible changes include:

- *Controller.* A new controller may require minor changes in your code.
- *Component tolerances.* Module components have manufacturing tolerances. In extreme cases, the tolerance stack can change the visual or operating characteristics.

Please understand that we avoid changing a module whenever possible; we only discontinue a module if we have no other option. We will post Part Change Notices on the product's webpage as soon as possible. If interested, you can subscribe to future part change notifications.

CARE AND HANDLING PRECAUTIONS

For optimum operation of the module and to prolong its life, please follow the precautions below. Excessive voltage will shorten the life of the module. You must drive the display within the specified voltage limit. (See [Absolute Maximum Ratings \(Pg. 16\)](#)).

ESD (ELECTRO-STATIC DISCHARGE)

The circuitry is industry standard CMOS logic and susceptible to ESD damage. Please use industry standard antistatic precautions as you would for any other static sensitive devices such as expansion cards, motherboards, or integrated circuits. Ground your body, work surfaces, and equipment.

DESIGN AND MOUNTING

- CFAL12822A-Y-B1 mates with standard 0.5 mm 24-pin ZIF sockets such as [OR721CT-ND](#), [OR709CT-ND](#), and [OR877CT-ND](#) sold by Digi-Key.
- The exposed surface of the "glass" is actually a polarizer laminated on top of the glass. To protect the soft plastic polarizer from damage, the module ships with a protective film over the polarizer. Please peel off the protective film slowly. Peeling off the protective film abruptly may generate static electricity.
- The polarizer is made out of soft plastic and is easily scratched or damaged. When handling the module, avoid touching the polarizer. Finger oils are difficult to remove.
- To protect the soft plastic polarizer from damage, place a transparent plate (for example, acrylic, polycarbonate, or glass) in front of the module, leaving a small gap between the plate and the display surface. We use GE HP-92 Lexan, which is readily available and works well.

- Do not disassemble or modify the module.
- The display can be mounted vertically onto a front panel using a variety of methods. If the enclosure is plastic, it can be molded to have the display snap into place. A metal enclosure can use a milled faceplate with mounting tabs to secure the module. Adhesives can be used, as long as they are not similar to "super-glue" because these emit vapors that can damage the display over time.
- Do not reverse polarity to the power supply connections. Reversing polarity will immediately ruin the module.
- Use care to keep the exposed terminals clean. Contamination, including fingerprints, may make the reliability of the connection poor.
- Sharp bends can damage the FFC. Do not crease FFC. Do not bend FFC tightly against the edge of the OLED panel. Do not repeatedly bend the FFC beyond its elastic region. Limit bend radius to at least R5.00 mm.

Figure 7. Limit Bend Radius of FFC

AVOID SHOCK, IMPACT, TORQUE, OR TENSION

- Do not expose the module to strong mechanical shock, impact, torque, or tension.
- Do not drop, toss, bend, or twist the module.
- Do not place weight or pressure on the module.

CLEANING

- The polarizer (laminated to the glass) is soft plastic. The soft plastic is easily scratched or damaged. Be very careful when you clean the polarizer.
- Do not clean the polarizer with liquids. Do not wipe the polarizer with any type of cloth or swab (for example, Q-tips).
- Use the removable protective film to remove smudges (for example, fingerprints) and any foreign matter. If you no longer have the protective film, use standard transparent office tape (for example, Scotch® brand "Crystal Clear Tape"). If the polarizer is dusty, you may carefully blow it off with clean, dry, oil-free compressed air.

OPERATION

- We do not recommend connecting this module to a PC's parallel port as an "end product." This module is not "user friendly" and connecting it to a PC's parallel port is often difficult, frustrating, and can result in a "dead" display due to mishandling. For more information, see our forum thread at <http://www.crystalfontz.com/forum/showthread.php?s=&threadid=3257>.
- Your circuit should be designed to protect the module from ESD and power supply transients.
- Observe the operating temperature limitations: from -20°C minimum to +70°C maximum with minimal fluctuations. Operation outside of these limits may shorten the life and/or harm the display.
- Operate away from dust, moisture, and direct sunlight.

STORAGE AND RECYCLING

- Store in an ESD-approved container away from dust, moisture, and direct sunlight, fluorescent lamps, or any ultraviolet ray.
- Observe the storage temperature limitations: from -30°C minimum to +80°C maximum with minimal fluctuations. Rapid temperature changes can cause moisture to form, resulting in permanent damage.
- Do not allow weight to be placed on the modules while they are in storage.
- Please recycle your outdated Crystalfontz modules at an approved facility.

APPENDIX A: QUALITY ASSURANCE STANDARDS

INSPECTION CONDITIONS

- Environment
 - Temperature: $25\pm 5^{\circ}\text{C}$
 - Humidity: 30~85% RH (noncondensing)
- For visual inspection of active display area
 - Source lighting: two 20-Watt or one 40-Watt fluorescent light
 - Display adjusted for best contrast
 - Viewing distance: 30 ± 5 cm (about 12 inches)
 - Viewing angle: inspect at 45° angle of vertical line right and left, top and bottom

COLOR DEFINITIONS

We try to describe the appearance of our modules as accurately as possible. For the photos, we adjust for optimal appearance. Actual display appearance may vary due to (1) different operating conditions, (2) small variations of component tolerances, (3) inaccuracies of our camera, (4) color interpretation of the photos on your monitor, and/or (5) personal differences in the perception of color.

DEFINITION OF ACTIVE AREA AND VIEWING AREA

ACCEPTANCE SAMPLING

DEFECT TYPE	AQL*
Major	$\leq .65\%$
Minor	$<1.0\%$
* Acceptable Quality Level: maximum allowable error rate or variation from standard	

DEFECTS CLASSIFICATION

Defects are defined as:

- Major Defect: results in failure or substantially reduces usability of unit for its intended purpose
- Minor Defect: deviates from standards but is not likely to reduce usability for its intended purpose

ACCEPTANCE STANDARDS

#	DEFECT TYPE	CRITERIA			MAJOR / MINOR	
1	Electrical defects	1. No display, display malfunctions, or shorted segments. 2. Current consumption exceeds specifications.			Major	
2	Viewing area defect	Viewing area does not meet specifications.			Major	
3	Blemishes or foreign matter on display segments		<i>Defect Size</i>	<i>Acceptable Qty</i>	Minor	
			≤ 0.30 mm	3		
			≤ 2 defects within 10 mm of each other			
4	Dark lines or scratches in display area		<i>Defect Width</i>	<i>Defect Length</i>	<i>Acceptable Qty</i>	Minor
			≤ 0.03 mm	≤ 3.0 mm	3	
			0.03 to 0.05	≤ 2.0 mm	2	
			0.05 to 0.08	≤ 2.0 mm	1	
			0.08 to 0.10	≤ 3.0 mm	0	
			≥ 0.10	> 3.0 mm	0	
5	Bubbles between polarizer film and glass		<i>Defect Size</i>	<i>Acceptable Qty</i>	Minor	
			≤ 0.20 mm	Ignore		
			0.20 to 0.40 mm	3		
			0.40 to 0.60 mm	2		
			≥ 0.60 mm	0		
6	Display pattern defect		<i>Pixel Size</i>	<i>Acceptable Qty</i>	Minor	
			$((A+B)/2) \leq 0.20$ mm	≤ 3 total defects ≤ 2 pinholes per digit		
			$C > 0$ mm			
			$((D+E)/2) \leq 0.25$ mm			
			$((F+G)/2) \leq 0.25$ mm			

#	DEFECT TYPE	CRITERIA	MAJOR / MINOR
7	PCB defects	<ol style="list-style-type: none">1. Oxidation or contamination on connectors.*2. Wrong parts, missing parts, or parts not in specification.*3. Jumpers set incorrectly.4. Solder (if any) on bezel, LED pad, zebra pad, or screw hole pad is not smooth. *Minor if display functions correctly. Major if the display fails.	Minor
8	Soldering defects	<ol style="list-style-type: none">1. Unmelted solder paste.2. Cold solder joints, missing solder connections, or oxidation.*3. Solder bridges causing short circuits.*4. Residue or solder balls.5. Solder flux is black or brown. *Minor if display functions correctly. Major if the display fails.	Minor

APPENDIX B: SAMPLE CODE

SOURCES FOR DRIVER LIBRARIES

Graphic driver libraries may save a lot of time and help you develop a more professional product. Possible library sources are [easyGUI](#), [en.radzio.dxp.pl](#), [Gwentech](#), [Micrium](#), [RAMTEX](#), and [Segger emWin](#).

SAMPLE CODE

This code will initialize the display and then show an image, toggling between inverted and not inverted. You can download the complete source from this link: <http://www.crystalfontz.com/products/document/1827/CFAL12822A.zip>.

Note: Please observe V_{PANEL} sequencing as described in [Details of Interface Pin Function \(Pg. 18\)](#). See also [Power Up and Power Down Sequencing \(Pg. 16\)](#).

APPENDIX C: OLED MODULE TERMS AND SYMBOLS

Symbol	Description
C	Capacitor
cd/m ² nit	Candela meter squared is the standard unit of measurement for luminous intensity (photometric brightness).
CIE	A color model based on human perception developed by the CIE (Commission Internationale de l'Eclairage) committee.
CLS	Clock select pin.
COF COT TAB	Chip On Flex. Controller is on the FPC. Similar in appearance to "TAB." The flex circuit on COF is typically much thinner than the flex of a "flex tail."
COG	Chip On Glass. Controller is on the glass panel.
COM	Common driver. Common signal output for OLED display.
CR	Contrast Ratio = (brightness with pixels light)/(brightness with pixels dark).
$\overline{\text{CS}}$ CS# CSB	Chip select input. <i>Low:</i> Controller chip is selected. Communications with host is possible. <i>High:</i> Controller chip is not selected. Host interface signals are ignored by the controller.
D	Diode
DB0 ~ DBn D0 ~ Dn	Bidirectional databus connects to 8-bit or 16-bit standard host databus. When SPI (serial interface) is selected, DB0 serves as the serial clock input signal (SCL or SCLK) and DB1 serves as the serial data input signal (SI or SDIN). DB2 to DBn are set to high impedance.
$\overline{\text{D/C}}$ RS A0 CD D/C# SD/C	Data/Command control. Determines whether data bits are data or command. <i>1 – High:</i> Addresses the data register. <i>0 – Low:</i> Addresses the command register.
ESD	Electro-Static Discharge. Sudden and brief electrical current that flows between two objects. ESD between a human and a OLED module can cause permanent damage.
FB	Feedback input for the booster circuit. Use to adjust booster output voltage level, V _{PANEL} .
FFC	Flat Flex Cable. Used for Touch Screen connection. Also called "pigtail."
FG	Frame Ground.
FPC	Flexible Printed Circuit. Also called "flex tail." Typically much thicker than the "flex" film of COF (Chip On Flex).
GDR	Gate Drive. Output signal drives the gate of the external NMOS of the booster circuit.

Symbol	Description (Continued)															
GND V _{SS}	Power supply and signal ground. Must be connected to an external ground.															
I _{LOGIC} I _{DD}	Operating current for V _{LOGIC} .															
I _{LOGIC, SLEEP} I _{DD, SLEEP}	Sleep mode current for V _{LOGIC} .															
I _{PANEL} I _{CC}	Supply current for V _{PANEL} .															
I _{PANEL, SLEEP} I _{CC, SLEEP}	Sleep mode current for V _{PANEL} .															
I _{REF}	Segment output current reference for brightness adjustment. A resistor should be connected between this pin and GND. Used to set the current.															
I/O	Input/Output.															
IM _n	Interface mode select pin. (Where <i>n</i> is the corresponding number.)															
IS1 BS1 C86 M80	<table border="1"> <thead> <tr> <th>IS1</th> <th>IS2</th> <th>Interface Mode</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>SPI (Serial), if available</td> </tr> <tr> <td>0</td> <td>1</td> <td>6800 Parallel, if available</td> </tr> <tr> <td>1</td> <td>0</td> <td>Not Allowed</td> </tr> <tr> <td>1</td> <td>1</td> <td>8080 Parallel</td> </tr> </tbody> </table>	IS1	IS2	Interface Mode	0	0	SPI (Serial), if available	0	1	6800 Parallel, if available	1	0	Not Allowed	1	1	8080 Parallel
IS1		IS2	Interface Mode													
0		0	SPI (Serial), if available													
0		1	6800 Parallel, if available													
1	0	Not Allowed														
1	1	8080 Parallel														
IS2 BS2 P/S MS MS̄ M/S#																
L _{BRNORMAL} IV	Luminous Intensity Brightness, NORMAL operation.															
L _{BRSTANDBY} IV	Luminous Intensity Brightness, STANDBY.															
mm	Millimeter or millimetre. Unit of length equal to one thousandth of a meter. 1 millimeter = 0.0394 inches.															
mW	Milliwatt is equal to one thousandth of a Watt. Watts = Volts x Amps.															
NC nc	Make no connection.															
OLED	Organic light-emitting diode.															
P _{OPERATION} P _T	Normal mode Power consumption.															
P _{STANDBY}	Standby mode Power consumption.															

Symbol	Description (Continued)
Q	Transistor, including FET and MOSFET.
R	Resistor
\overline{RD}_{8080} (E_{6800}) \overline{RD} (E) E (\overline{RD}) E RDB	Host interface input. <i>8080 Host:</i> Active low. Signal on the databus is latched at the rising edge of \overline{RD} . <i>6800 Host (if available):</i> Enable control signal input active high. E = High: Read or Write operation is active. E = Low: No operation.
RH Rh	Relative Humidity.
RoHS	Restriction of Hazardous Substances Directive, an environmental standard.
\overline{RST} \overline{RES} RST# RES# RSTB RESET	Reset signal. <i>Low:</i> Display controller is reset. The \overline{RST} pin should be pulsed low shortly after power is applied. <i>High:</i> The \overline{RST} pin should be brought high for normal operation.
SCL SCK	Serial Clock signal.
SDO MISO	Data output pin in serial interface. SDO = Serial Data Out MISO = Master In, Slave Out
SEG	Segment driver. Segment signal output for OLED display.
SENSE	Source current for external NMOS of booster circuit.
SI SDI MOSI	Data input pin in serial interface. SDI = Serial Data In MOSI - Master Out, Slave In
SW	Switch output drives the gate of the external NMOS of the booster circuit.
T _a TA	“Ambient temperature” is the temperature of the air that surrounds a component.
T _{OP}	Operating temperature.
T _{ST} T _{STG}	Storage Temperature.
V _{BREF}	Internal voltage reference for booster circuit. A decoupling capacitor, typically 1μF, should be connected to GND.

Symbol	Description (Continued)
V_{COL}	Column Supply Voltage. This is odd and even column supply voltage. It can be supplied externally or by connecting to V_{PANEL} .
V_{COMH}	High level voltage output for common signals. A low ESR capacitor should be connected between this pin and GND. Do not connect external power supply directly to this pin.
V_{IH} V_{ICH}	High level input voltage.
V_{IL} V_{LCH}	Low level input voltage.
V_{LOGIC}	Power supply input. Must be connected to an external source.
$V_{LOGIC\ I/O}$ V_{DD} V_{DD1} V_{CC} (if it has PCB) $V_{DD\ I/O}$ $V_{I/O}$ V_{CCIO}	Supply voltage for I/O signals.
V_{OH} V_{OHC}	High level output voltage.
V_{OL} V_{OLC}	Low level output voltage.
V_{PANEL} V_{PP} V_{CC} (if no PCB)	<p>Driver supply voltage. Only high voltage input on chip. Power must be supplied externally. <i>Note: You must observe power sequencing for this signal.</i></p> <p><i>Power Up</i> – Display must be powered up and initialized before power is applied to the signal.</p> <p><i>Power Down</i> – Power must be removed from this signal before the display is powered off.</p> 
V_{REF}	Voltage reference pin for pre-charge voltage in driving OLED device. Voltage should be set to match with the OLED driving voltage in current drive phase. It can either be supplied externally or by connecting to V_{PANEL} .

Symbol	Description (Continued)
V_{ROW}	Row Driver Supply. This is odd and even row power supply. It can be supplied externally or by connecting to V_{PANEL} .
V_{SL}	Segment voltage reference pin. This pin should be left open.
\overline{WR}_{8080} (R/\overline{W}_{6800}) $\overline{R/\overline{W}}$ (\overline{WR}) \overline{WR} (R/\overline{W}) $R/W\#$ WRB	<p>Host interface input.</p> <p><i>8080 Host:</i> Active low. Signal on the databus is latched at the rising edge of \overline{WR} signal.</p> <p><i>6800 Host (if available):</i> Read/Write control signal output.</p> <p>R/\overline{W} = High: Read (Host←Module)</p> <p>R/\overline{W} = Low: Write (Host→Module)</p>

APPENDIX D: SOLOMON SYSTECH SSD1305 CONTROLLER SPECIFICATION SHEET

The complete *Solomon Systech 132 x 64 Dot Matrix OLED/PLED Segment/Common Driver with Controller Data Sheet* (Rev 2.0, Oct 2008, 71 pages) follows.

SSD1305

Advance Information

132 x 64 Dot Matrix OLED/PLED Segment/Common Driver with Controller

This document contains information on a new product. Specifications and information herein are subject to change without notice.

Appendix: IC Revision history of SSD1305 Specification

Version	Change Items	Effective Date
1.0	Change to Advance Info.	27-Mar-06
1.1	Revise command 91h Add a note on the capacitor value in Section 13 Application Example Add I2C Interface	28-Apr-06
1.2	Revise CL pin description in Table 7-1 Revise Figure 10-6	26-Jun-06
1.3	Revise section 8.1.2 & Section 13 Add Figure 10-7	17-Aug-06
1.4	Remove software reset command (E2h) Revise command 26h/27h/29h/2Ah (Set time interval between each scroll step)	06-Sep-06
1.5	Revise Figure 14-1 Application Example Revise Die thickness to 457um from 475um	22-Sep-06
1.6	Revise “Bump Size” of pin “127-147, 294-314” Revise Figure 10-6 ,Figure 8-5 , Figure 13-4	21-Dec-06
1.7	Add light sensitive note In Section 11 – Maximum ratings Revise Note 2 in Section 8.10 Power ON/OFF sequence by adding the word “disable” Add China RoHS disclaimer at the last page.	16-May-07
1.8	For SPI/6800/8080 MCU interface, change the Rise / Fall time (tR/tF) to max. 40ns Revise typo in SSD1305T6R1 dwg on P.68 pitch: From 0.85 change to 0.845	02-Aug-07
1.9	Add SSD1305Z3 in ordering information & add die tray Revise CL pin to “connected to VSS” in Section 8.3 Revise typo in page 42 : from “upper column address is 00h” to “upper column address is 10h”	23-May-08
2.0	Add IC revision history on spec	27-Oct-08

1 GENERAL DESCRIPTION

The SSD1305 is a CMOS OLED/PLED driver with controller for organic/polymer light emitting diode dot-matrix graphic display system. It consists of 132 segments and 64 commons that can support a maximum display resolution of 132x64. There are 4-color selections to support monochrome or area color OLED/PLED. This IC is designed for Common Cathode type OLED panel.

The SSD1305 embeds with contrast control, display RAM and oscillator, which reduces the number of external components and power consumption. It has 256-step brightness control and separate power for I/O interface logic. It is suitable for many compact portable applications, such as mobile phone sub-display, calculator and MP3 player, etc.

2 FEATURES

- Resolution: 132 x 64 dot matrix panel
- Area color support with 4 Color Selection and 64 steps per color
- Power supply:
 - $V_{DD} = 2.4V$ to $3.5V$ for IC logic
 - $V_{CC} = 7.0V$ to $15.0V$ for Panel driving
 - $V_{DDIO} = 1.6V$ to V_{DD} for MCU interface
- Segment maximum source current: 320uA
- Common maximum sink current: 45mA
- Embedded 132 x 64 bit SRAM display buffer
- 256-step Contrast Control
- 8-bit 6800-series Parallel Interface, 8-bit 8080-series Parallel Interface, Serial Peripheral Interface, I²C Interface
- Row Re-mapping and Column Re-mapping
- Continuous Horizontal, Vertical and Diagonal Scrolling
- Dim Mode operations
- Programmable Frame Frequency and Multiplexing Ratio
- On-Chip Oscillator
- Low power consumption
- Wide range of operating temperatures: -40 to 85 °C

7 PIN DESCRIPTION

Key: I = Input, O =Output, IO = Bi-directional (input/output), P = Power pin

Table 7-1 : Pin Description

Pin Name	Pin Type	Description
V _{DD}	P	Power supply pin for core logic operation.
V _{DDIO}	P	Power supply for interface logic level. It should be match with MCU interface voltage level. V _{DDIO} must always be equal or lower than V _{DD} .
V _{CC}	P	Power supply for panel driving voltage. This is also the most positive power voltage supply pin.
V _{SS}	P	This is a ground pin.
V _{LSS}	P	This is an analog ground pin. It should be connected to V _{SS} externally.
V _{COMH}	O	The pin for COM signal deselected voltage level. A capacitor should be connected between this pin and V _{SS} .
BGGND	P	This pin must be connected to ground.
V _{DDB}	P	This is a reserved pin. It must be connected to V _{DD} .
V _{SSB}	P	This is a reserved pin. It must be connected to V _{SS} .
GDR	O	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
FB	I	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
V _{BREF}	P	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
V _{CIR}	O	This is a reserved pin. It should be kept NC (i.e. Float during normal operation).
BS[2:0]	I	MCU bus interface selection pins. Please refer to Table 7-2 for the details of setting.
I _{REF}	I	This is segment output current reference pin. A resistor should be connected between this pin and V _{SS} to maintain the I _{REF} current at 10uA. Please refer to Figure 8-18 for the details of resistor value.
FR	O	This pin outputs RAM write synchronization signal. Proper timing between MCU data writing and frame display timing can be achieved to prevent tearing effect. It should be kept NC if it is not used. Please refer to Section 8.4 for details usage.
CL	I	This is external clock input pin. When internal clock is enabled (i.e. HIGH in CLS pin), this pin is not used and should be connected to V _{SS} . When internal clock is disabled (i.e. LOW in CLS pin), this pin is the external clock source input pin.
CLS	I	This is internal clock enable pin. When it is pulled HIGH (i.e. connect to V _{DDIO}), internal clock is enabled. When it is pulled LOW, the internal clock is disabled; an external clock source must be connected to the CL pin for normal operation.
RES#	I	This pin is reset signal input. When the pin is LOW, initialization of the chip is executed. Keep this pin HIGH (i.e. connect to V _{DDIO}) during normal operation.

Pin Name	Pin Type	Description
CS#	I	This pin is the chip select input. (active LOW)
D/C#	I	This is Data/Command control pin. When it is pulled HIGH (i.e. connect to V _{DDIO}), the data at D[7:0] is treated as data. When it is pulled LOW, the data at D[7:0] will be transferred to the command register. In I ² C mode, this pin acts as SA0 for slave address selection. For detail relationship to MCU interface signals, please refer to the Timing Characteristics Diagrams: Figure 13-1 to Figure 13-5.
E (RD#)	I	When interfacing to a 6800-series microprocessor, this pin will be used as the Enable (E) signal. Read/write operation is initiated when this pin is pulled HIGH (i.e. connect to V _{DDIO}) and the chip is selected. When connecting to an 8080-microprocessor, this pin receives the Read (RD#) signal. Read operation is initiated when this pin is pulled LOW and the chip is selected. When serial interface is selected, this pin must be connected to V _{SS} .
R/W#(WR#)	I	This is read / write control input pin connecting to the MCU interface. When interfacing to a 6800-series microprocessor, this pin will be used as Read/Write (R/W#) selection input. Read mode will be carried out when this pin is pulled HIGH (i.e. connect to V _{DDIO}) and write mode when LOW. When 8080 interface mode is selected, this pin will be the Write (WR#) input. Data write operation is initiated when this pin is pulled LOW and the chip is selected. When serial interface is selected, this pin must be connected to V _{SS} .
D[7:0]	IO	These are 8-bit bi-directional data bus to be connected to the microprocessor's data bus. When serial interface mode is selected, D0 will be the serial clock input: SCLK; D1 will be the serial data input: SDIN and D2 should be left opened. When I ² C mode is selected, D2, D1 should be tied together and serve as SDA _{out} , SDA _{in} in application and D0 is the serial clock input, SCL.
TR0-TR11	-	Testing reserved pins. It should be kept NC.
SEG0 ~ SEG131	O	These pins provide Segment switch signals to OLED panel. They are in high impedance stage when display is OFF.
COM0 ~ COM63	O	These pins provide Common switch signals to OLED panel. They are in high impedance state when display is OFF.
NC	-	This is dummy pin. Do not group or short NC pins together.

Table 7-2 : MCU Bus Interface Pin Selection

Pin Name	I ² C Interface	6800-parallel interface (8 bit)	8080-parallel interface (8 bit)	Serial interface
BS0	0	0	0	0
BS1	1	0	1	0
BS2	0	1	1	0

Note

⁽¹⁾ 0 is connected to V_{SS}

⁽²⁾ 1 is connected to V_{DDIO}

8 FUNCTIONAL BLOCK DESCRIPTIONS

8.1 MCU Interface selection

SSD1305 MCU interface consist of 8 data pins and 5 control pins. The pin assignment at different interface mode is summarized in Table 8-1. Different MCU mode can be set by hardware selection on BS[2:0] pins (please refer to Table 7-2 for BS[2:0] setting).

Table 8-1 : MCU interface assignment under different bus interface mode

Pin Name Bus Interface	Data/Command Interface								Control Signal				
	D7	D6	D5	D4	D3	D2	D1	D0	E	R/W#	CS#	D/C#	RES#
8-bit 8080	D[7:0]								RD#	WR#	CS#	D/C#	RES#
8-bit 6800	D[7:0]								E	R/W#	CS#	D/C#	RES#
SPI	Tie LOW				NC	SDIN	SCLK	Tie LOW		CS#	D/C#	RES#	
I ² C	Tie LOW				SDA _{OUT}	SDA _{IN}	SCL	Tie LOW		SA0	RES#		

8.1.1 MCU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), R/W#, D/C#, E and CS#.

A LOW in R/W# indicates WRITE operation and HIGH in R/W# indicates READ operation.
 A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.
 The E input serves as data latch signal while CS# is LOW. Data is latched at the falling edge of E signal.

Table 8-2 : Control pins of 6800 interface

Function	E	R/W#	CS#	D/C#
Write command	↓	L	L	L
Read status	↓	H	L	L
Write data	↓	L	L	H
Read data	↓	H	L	H

Note

- ⁽¹⁾ ↓ stands for falling edge of signal
- H stands for HIGH in signal
- L stands for LOW in signal

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-1.

Figure 8-1 : Data read back procedure - insertion of dummy read

8.1.2 MCU Parallel 8080-series Interface

The parallel interface consists of 8 bi-directional data pins (D[7:0]), RD#, WR#, D/C# and CS#.

A LOW in D/C# indicates COMMAND read/write and HIGH in D/C# indicates DATA read/write.

A rising edge of RD# input serves as a data READ latch signal while CS# is kept LOW.

A rising edge of WR# input serves as a data/command WRITE latch signal while CS# is kept LOW.

Figure 8-2 : Example of Write procedure in 8080 parallel interface mode

Figure 8-3 : Example of Read procedure in 8080 parallel interface mode

Table 8-3 : Control pins of 8080 interface (Form 1)

Function	RD#	WR#	CS#	D/C#
Write command	H	↑	L	L
Read status	↑	H	L	L
Write data	H	↑	L	H
Read data	↑	H	L	H

Note

- (1) ↑ stands for rising edge of signal
- (2) H stands for HIGH in signal
- (3) L stands for LOW in signal
- (4) Refer to Figure 13-2 for Form 1 8080-Series MPU Parallel Interface Timing Characteristics

Alternatively, RD# and WR# can be keep stable while CS# serves as the data/command latch signal.

Table 8-4 : Control pins of 8080 interface (Form 2)

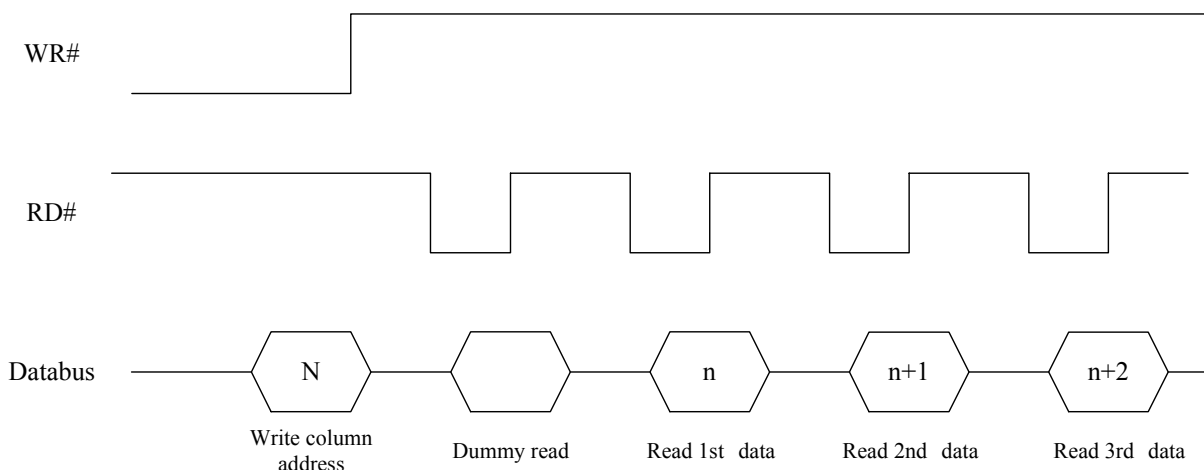

Function	RD#	WR#	CS#	D/C#
Write command	H	L	↑	L
Read status	L	H	↑	L
Write data	H	L	↑	H
Read data	L	H	↑	H

Note

- (1) ↑ stands for rising edge of signal
- (2) H stands for HIGH in signal
- (3) L stands for LOW in signal
- (4) Refer to Figure 13-3 for Form 2 8080-Series MPU Parallel Interface Timing Characteristics

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 8-4.

Figure 8-4 : Display data read back procedure - insertion of dummy read

8.1.3 MCU Serial Interface

The serial interface consists of serial clock SCLK, serial data SDIN, D/C#, CS#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN. For the unused data pins, D2 should be left open. The pins from D3 to D7, E and R/W# can be connected to an external ground.

Table 8-5 : Control pins of Serial interface

Function	E(RD#)	R/W#(WR#)	CS#	D/C#	D0	Note
Write command	Tie LOW	Tie LOW	L	L	↑	(1) ↑ stands for rising edge of signal
Write data	Tie LOW	Tie LOW	L	H	↑	(2) H stands for HIGH in signal (3) L stands for LOW in signal

SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D7, D6, ... D0. D/C# is sampled on every eighth clock and the data byte in the shift register is written to the Graphic Display Data RAM (GDDRAM) or command register in the same clock.

Under serial mode, only write operations are allowed.

Figure 8-5 : Write procedure in SPI mode

8.1.4 MCU I²C Interface

The I²C communication interface consists of slave address bit SA0, I²C-bus data signal SDA (SDA_{OUT}/D₂ for output and SDA_{IN}/D₁ for input) and I²C-bus clock signal SCL (D₀). Both the data and clock signals must be connected to pull-up resistors. RES# is used for the initialization of device.

a) Slave address bit (SA0)

SSD1305 has to recognize the slave address before transmitting or receiving any information by the I²C-bus. The device will respond to the slave address following by the slave address bit (“SA0” bit) and the read/write select bit (“R/W#” bit) with the following byte format,

b₇ b₆ b₅ b₄ b₃ b₂ b₁ b₀
 0 1 1 1 1 0 SA0 R/W#

“SA0” bit provides an extension bit for the slave address. Either “0111100” or “0111101”, can be selected as the slave address of SSD1305. D/C# pin acts as SA0 for slave address selection.

“R/W#” bit is used to determine the operation mode of the I²C-bus interface. R/W#=1, it is in read mode. R/W#=0, it is in write mode.

b) I²C-bus data signal (SDA)

SDA acts as a communication channel between the transmitter and the receiver. The data and the acknowledgement are sent through the SDA.

It should be noticed that the ITO track resistance and the pulled-up resistance at “SDA” pin becomes a voltage potential divider. As a result, the acknowledgement would not be possible to attain a valid logic 0 level in “SDA”.

“SDA_{IN}” and “SDA_{OUT}” are tied together and serve as SDA. The “SDA_{IN}” pin must be connected to act as SDA. The “SDA_{OUT}” pin may be disconnected. When “SDA_{OUT}” pin is disconnected, the acknowledgement signal will be ignored in the I²C-bus.

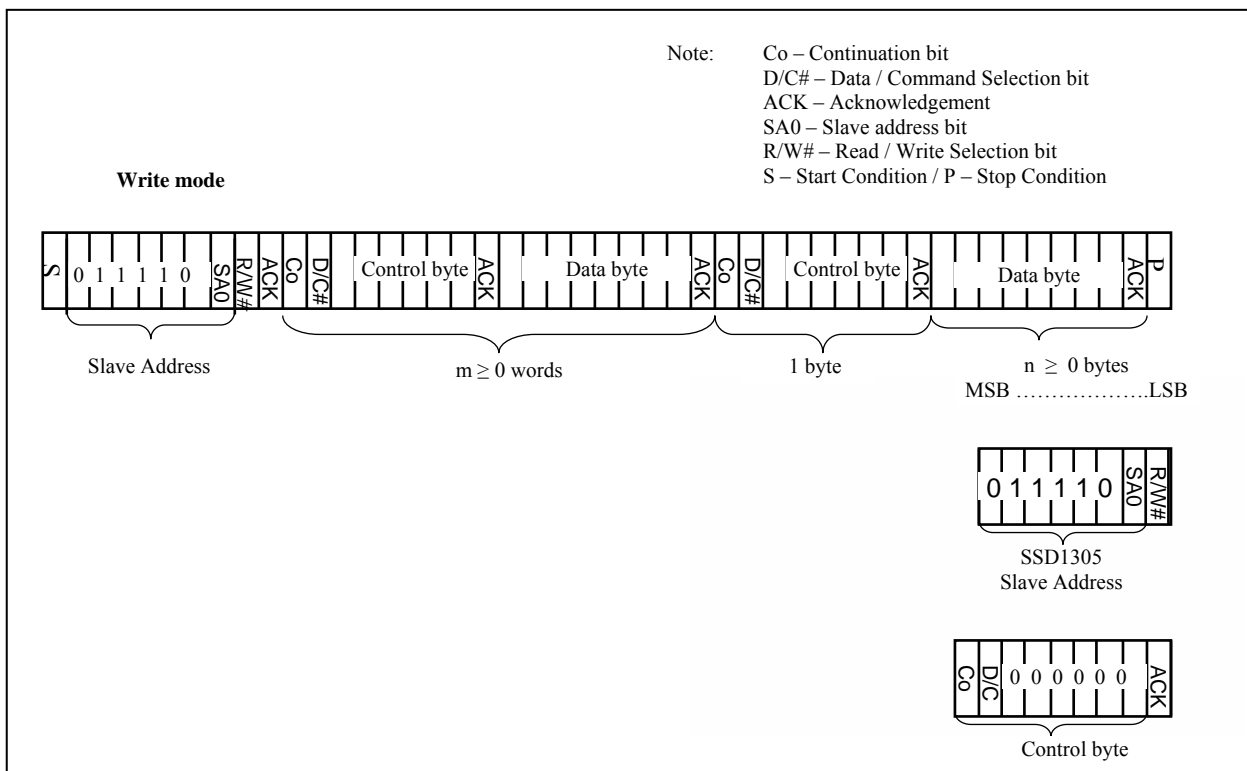

c) I²C-bus clock signal (SCL)

The transmission of information in the I²C-bus is following a clock signal, SCL. Each transmission of data bit is taken place during a single clock period of SCL.

8.1.4.1 I²C-bus Write data

The I²C-bus interface gives access to write data and command into the device. Please refer to Figure 8-6 for the write mode of I²C-bus in chronological order.

Figure 8-6 : I²C -bus data format

8.1.4.2 Write mode for I²C

- 1) The master device initiates the data communication by a start condition. The definition of the start condition is shown in Figure 8-7. The start condition is established by pulling the SDA from HIGH to LOW while the SCL stays HIGH.
- 2) The slave address is following the start condition for recognition use. For the SSD1305, the slave address is either “b0111100” or “b0111101” by changing the SA0 to LOW or HIGH (D/C pin acts as SA0).
- 3) The write mode is established by setting the R/W# bit to logic “0”.
- 4) An acknowledgement signal will be generated after receiving one byte of data, including the slave address and the R/W# bit. Please refer to the Figure 8-8 for the graphical representation of the acknowledge signal. The acknowledge bit is defined as the SDA line is pulled down during the HIGH period of the acknowledgement related clock pulse.
- 5) After the transmission of the slave address, either the control byte or the data byte may be sent across the SDA. A control byte mainly consists of Co and D/C# bits following by six “0” ‘s.
 - a. If the Co bit is set as logic “0”, the transmission of the following information will contain data bytes only.
 - b. The D/C# bit determines the next data byte is acted as a command or a data. If the D/C# bit is set to logic “0”, it defines the following data byte as a command. If the D/C# bit is set to logic “1”, it defines the following data byte as a data which will be stored at the GDDRAM. The GDDRAM column address pointer will be increased by one automatically after each data write.
- 6) Acknowledge bit will be generated after receiving each control byte or data byte.
- 7) The write mode will be finished when a stop condition is applied. The stop condition is also defined in Figure 8-7. The stop condition is established by pulling the “SDA in” from LOW to HIGH while the “SCL” stays HIGH.

Figure 8-7 : Definition of the Start and Stop Condition

Figure 8-8 : Definition of the acknowledgement condition

Please be noted that the transmission of the data bit has some limitations.

1. The data bit, which is transmitted during each SCL pulse, must keep at a stable state within the “HIGH” period of the clock pulse. Please refer to the Figure 8-9 for graphical representations. Except in start or stop conditions, the data line can be switched only when the SCL is LOW.
2. Both the data line (SDA) and the clock line (SCL) should be pulled up by external resistors.

Figure 8-9 : Definition of the data transfer condition

8.2 Command Decoder

This module determines whether the input data is interpreted as data or command. Data is interpreted based upon the input of the D/C# pin.

If D/C# pin is HIGH, D[7:0] is interpreted as display data written to Graphic Display Data RAM (GDDRAM). If it is LOW, the input at D[7:0] is interpreted as a command. Then data input will be decoded and written to the corresponding command register.

8.3 Oscillator Circuit and Display Time Generator

Figure 8-10 : Oscillator Circuit and Display Time Generator

This module is an on-chip LOW power RC oscillator circuitry. The operation clock (CLK) can be generated either from internal oscillator or external source CL pin. This selection is done by CLS pin. If CLS pin is pulled HIGH, internal oscillator is chosen and CL should be connected to V_{SS}. Pulling CLS pin LOW disables internal oscillator and external clock must be connected to CL pins for proper operation. When the internal oscillator is selected, its output frequency F_{osc} can be changed by command D5h A[7:4].

The display clock (DCLK) for the Display Timing Generator is derived from CLK. The division factor “D” can be programmed from 1 to 16 by command D5h

$$DCLK = F_{OSC} / D$$

The frame frequency of display is determined by the following formula.

$$F_{FRM} = \frac{F_{osc}}{D \times K \times \text{No. of Mux}}$$

where

- D stands for clock divide ratio. It is set by command D5h A[3:0]. The divide ratio has the range from 1 to 16.
- K is the number of display clocks per row. The value is derived by
 $K = \text{Phase 1 period} + \text{Phase 2 period} + \text{BANK0 pulse width}$
 $= 2 + 2 + 50 = 54$ at power on reset
 (Please refer to Section 8.6 “Segment Drivers / Common Drivers” for the details of the “Phase”)
- Number of multiplex ratio is set by command A8h. The power on reset value is 63 (i.e. 64MUX).
- F_{OSC} is the oscillator frequency. It can be changed by command D5h A[7:4]. The higher the register setting results in higher frequency.

8.4 FR synchronization

FR synchronization signal can be used to prevent tearing effect.

The starting time to write a new image to OLED driver is depended on the MCU writing speed. If MCU can finish writing a frame image within one frame period, it is classified as fast write MCU. For MCU needs longer writing time to complete (more than one frame but within two frames), it is a slow write one.

For fast write MCU: MCU should start to write new frame of ram data just after rising edge of FR pulse and should be finished well before the rising edge of the next FR pulse.

For slow write MCU: MCU should start to write new frame ram data after the falling edge of the 1st FR pulse and must be finished before the rising edge of the 3rd FR pulse.

8.5 Reset Circuit

When RES# input is LOW, the chip is initialized with the following status:

1. Display is OFF
2. 132 x 64 Display Mode
3. Normal segment and display data column address and row address mapping (SEG0 mapped to address 00h and COM0 mapped to address 00h)
4. Shift register data clear in serial interface
5. Display start line is set at display RAM address 0
6. Column address counter is set at 0
7. Normal scan direction of the COM outputs
8. Contrast control register is set at 80h
9. Normal display mode (Equivalent to A4h command)

8.6 Segment Drivers / Common Drivers

Segment drivers deliver 132 current sources to drive the OLED panel. The driving current can be adjusted from 0 to 320uA with 256 steps. Common drivers generate voltage-scanning pulses.

The segment driving waveform is divided into three phases:

1. In phase 1, the OLED pixel charges of previous image are discharged in order to prepare for next image content display.
2. In phase 2, the OLED pixel is driven to the targeted voltage. The pixel is driven to attain the corresponding voltage level from V_{SS} . The period of phase 2 can be programmed in length from 1 to 15 DCLKs. If the capacitance value of the pixel of OLED panel is larger, a longer period is required to charge up the capacitor to reach the desired voltage.
3. In phase 3, the OLED driver switches to use current source to drive the OLED pixels and this is the current drive stage. SSD1305 employs PWM (Pulse Width Modulation) method to control the brightness of area color A, B, C, D color individually. The longer the waveform in current drive stage is, the brighter is the pixel and vice versa.

Figure 8-11 : Segment Output Waveform in three phases

After finishing phase 3, the driver IC will go back to phase 1 to display the next row image data. This three-step cycle is run continuously to refresh image display on OLED panel.

The length of phase 3 for area colors: A,B,C and monochrome BANK0 can be configured by command 91h "Set Look Up Table". There are 64 steps available for each color but the one of color D is fixed at 64. The unit of the step is in DCLK.

For example, the look up table for area color A, B, is set to 20, 40 DCLKs respectively. Color B is set to be brighter than color A. Then the result segment output waveform of these two colors is shown below.

Figure 8-12 : Segment Output Waveform for two different colors LUT setting

In phase 3, the segment output waveforms under the monochrome mode and area color mode are different.

In monochrome mode, if the length of current drive pulse width is set to 50, after finishing 50 DCLKs in current drive phase, the driver IC will go back to phase 1 for next row display.

Figure 8-13 : Example of Segment Output Waveform of monochrome display section under monochrome mode

In area color mode, the phase 3 of both BANK0 and area color banks (BANK1 to BANK32) are fixed into 64 DCLKs. For instance, if the length of the pulse width is set to 50, then after the end of 50 DCLKs of current drive phase, the segment waveform will be gone to V_{SS} level and the driver is still in current drive phase. This phase will be end after 64 DCLKs from the start of the phase is passed. And then the drive goes back to phase 1 for next row display. Figure 8-14 shows the example of the segment output waveform of area color display section when the pulse width of area color is set to 50.

Figure 8-14 : Example of Segment Output Waveform of area color display section under area color mode

8.7 Graphic Display Data RAM (GDDRAM)

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 132 x 64 bits and the RAM is divided into eight pages, from PAGE0 to PAGE7, as shown in Figure 8-15. In GDDRAM, PAGE0 and PAGE1 are belonged to area color section with resolution 132x16. PAGE2 to PAGE7 are used for monochrome 132x48 dot matrix display.

Figure 8-15 : GDDRAM pages structure of SSD1305

When one data byte is written into GDDRAM, all the rows image data of the same page of the current column are filled (i.e. the whole column (8 bits) pointed by the column address pointer is filled.). Data bit D0 is written into the top row, while data bit D7 is written into bottom row as shown in Figure 8-16.

Figure 8-16 : Enlargement of GDDRAM (No row re-mapping and column-remapping)

For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software as shown in Figure 8-15.

For vertical shifting of the display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display (command D3h).

8.8 Area Color Decoder

The 132x64 display matrix is divided into 8 pages. The first two pages, PAGE0 and PAGE1, are divided into 32 banks. BANK16 and BANK32 consist of a display area of 12x8 pixels. Other banks (BANK0 to BANK15 & BANK17 to BANK31) have matrices of 8x8 pixels. Each bank can be programmed to any one of the four colors (color A, B, C and D) as the example shown in Figure 8-17. Detailed operation can be referred to command 92h in Table 9-1.

Figure 8-17 : Example of area color assignment on a 132x64 OLED panel

8.9 SEG/COM Driving block

This block is used to derive the incoming power sources into the different levels of internal use voltage and current.

- V_{CC} is the most positive voltage supply.
- V_{COMH} is the Common deselected level. It is internally regulated.
- V_{LSS} is the ground path of the analog and panel current.
- I_{REF} is a reference current source for segment current drivers I_{SEG} . The relationship between reference current and segment current of a color is:

$$I_{SEG} = \text{Contrast} / 256 \times I_{REF} \times \text{scale factor}$$

in which

the contrast (0~255) is set by Set Contrast command 81h; and
the scale factor is 32 by default.

The magnitude of I_{REF} is controlled by the value of resistor, which is connected between I_{REF} pin and V_{SS} as shown in Figure 8-18. It is recommended to set I_{REF} to 10uA +/- 2uA so as to achieve $I_{SEG} = 320\mu\text{A}$ at maximum contrast 255.

Figure 8-18 : I_{REF} Current Setting by Resistor Value

Since the voltage at I_{REF} pin is $V_{CC} - 3\text{V}$, the value of resistor $R1$ can be found as below.

$$R1 = (\text{Voltage at } I_{REF} - V_{SS}) / I_{REF} = (V_{CC} - 3) / 10\mu\text{A} \approx 910\text{k}\Omega \text{ for } V_{CC} = 12\text{V}.$$

8.10 Power ON and OFF sequence

The following figures illustrate the recommended power ON and power OFF sequence of SSD1305 (assume V_{DD} and V_{DDIO} are at the same voltage level).

Power ON sequence:

1. Power ON V_{DD} , V_{DDIO} .
2. After V_{DD} , V_{DDIO} become stable, set RES# pin LOW (logic low) for at least 3 μ s (t_1)⁽⁴⁾ and then HIGH (logic high).
3. After set RES# pin LOW (logic low), wait for at least 3 μ s (t_2). Then Power ON V_{CC} .⁽¹⁾
4. After V_{CC} become stable, send command AFh for display ON. SEG/COM will be ON after 100ms (t_{AF}).

Figure 8-19 : The Power ON sequence

Power OFF sequence:

1. Send command AEh for display OFF.
2. Power OFF V_{CC} .^{(1), (2), (3)}
3. Wait for t_{OFF} . Power OFF V_{DD} , V_{DDIO} . (where Minimum $t_{OFF}=0$ ms⁽⁵⁾, Typical $t_{OFF}=100$ ms)

Figure 8-20 : The Power OFF sequence

Note:

- (1) Since an ESD protection circuit is connected between V_{DD} , V_{DDIO} and V_{CC} , V_{CC} becomes lower than V_{DD} whenever V_{DD} , V_{DDIO} is ON and V_{CC} is OFF as shown in the dotted line of V_{CC} in Figure 8-19 and Figure 8-20.
- (2) V_{CC} should be kept float (disable) when it is OFF.
- (3) Power Pins (V_{DD} , V_{CC}) can never be pulled to ground under any circumstance.
- (4) The register values are reset after t_1 .
- (5) V_{DD} should not be Power OFF before V_{CC} Power OFF.

9 COMMAND TABLE

Table 9-1: Command Table

(D/C#=0, R/W#(WR#) = 0, E(RD#=1) unless specific setting is stated)

Fundamental Command Table											
D/C#	Hex	D7	D6	D5	D4	D3	D2	D1	D0	Command	Description
0	00~0F	0	0	0	0	X ₃	X ₂	X ₁	X ₀	Set Lower Column Start Address for Page Addressing Mode	Set the lower nibble of the column start address register for Page Addressing Mode using X[3:0] as data bits. The initial display line register is reset to 0000b after RESET.
0	10~1F	0	0	0	1	X ₃	X ₂	X ₁	X ₀	Set Higher Column Start Address for Page Addressing Mode	Set the higher nibble of the column start address register for Page Addressing Mode using X[3:0] as data bits. The initial display line register is reset to 0000b after RESET.
0 0	20 A[1:0]	0 *	0 *	1 *	0 *	0 *	0 *	0 A ₁	0 A ₀	Set Memory Addressing Mode	A[1:0] = 00b, Horizontal Addressing Mode A[1:0] = 01b, Vertical Addressing Mode A[1:0] = 10b, Page Addressing Mode (RESET) A[1:0] = 11b, Invalid

Graphic Acceleration Command Table

D/C#	Hex	D7	D6	D5	D4	D3	D2	D1	D0	Command	Description
0	2E	0	0	1	0	1	1	1	0	Deactivate scroll	<p>Stop scrolling that is configured by command 26h/27h/29h/2Ah.</p> <p>Note ⁽¹⁾ After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.</p>
0	2F	0	0	1	0	1	1	1	1	Activate scroll	<p>Start scrolling that is configured by the scrolling setup commands :26h/27h/29h/2Ah with the following valid sequences: Valid command sequence 1: 26h ;2Fh. Valid command sequence 2: 27h ;2Fh. Valid command sequence 3: 29h ;2Fh. Valid command sequence 4: 2Ah ;2Fh.</p> <p>For example, if “26h; 2Ah; 2Fh.” commands are issued, the setting in the last scrolling setup command, i.e. 2Ah in this case, will be executed. In other words, setting in the last scrolling setup command overwrites the setting in the previous scrolling setup commands.</p>
0 0 0	A3 A[5:0] B[6:0]	1 * *	0 * B ₆	1 A ₅ B ₅	0 A ₄ B ₄	0 A ₃ B ₃	0 A ₂ B ₂	1 A ₁ B ₁	1 A ₀ B ₀	Set Vertical Scroll Area	<p>A[5:0] : Set No. of rows in top fixed area. The No. of rows in top fixed area is referenced to the top of the GDDRAM (i.e. row 0).[RESET = 0]</p> <p>B[6:0] : Set No. of rows in scroll area. This is the number of rows to be used for vertical scrolling. The scroll area starts in the first row below the top fixed area. [RESET = 64]</p> <p>Note ⁽¹⁾ A[5:0]+B[6:0] <= MUX ratio ⁽²⁾ B[6:0] <= MUX ratio ^(3a) Vertical scrolling offset (E[5:0] in 29h/2Ah) < B[6:0] ^(3b) Set Display Start Line (X5X4X3X2X1X0 of 40h~7Fh) < B[6:0] ⁽⁴⁾ The last row of the scroll area shifts to the first row of the scroll area. ⁽⁵⁾ For 64d MUX display A[5:0] = 0, B[6:0]=64 : whole area scrolls A[5:0]= 0, B[6:0] < 64 : top area scrolls A[5:0] + B[6:0] < 64 : central area scrolls A[5:0] + B[6:0] = 64 : bottom area scrolls Please refer to Figure 10-14 for details.</p>

Note

⁽¹⁾ “*” stands for “Don’t care”.

Table 9-2 : Read Command Table

Bit Pattern	Command	Description
D ₇ D ₆ D ₅ D ₄ D ₃ D ₂ D ₁ D ₀	Status Register Read	D[7] : Reserve D[6] : “1” for display OFF / “0” for display ON D[5] : Reserve D[4] : Reserve D[3] : Reserve D[2] : Reserve D[1] : Reserve D[0] : Reserve

Note

⁽¹⁾ Patterns other than those given in the Command Table are prohibited to enter the chip as a command; as unexpected results can occur.

9.1 Data Read / Write

To read data from the GDDRAM, select HIGH for both the R/W# (WR#) pin and the D/C# pin for 6800-series parallel mode and select LOW for the E (RD#) pin and HIGH for the D/C# pin for 8080-series parallel mode. No data read is provided in serial mode operation.

In normal data read mode the GDDRAM column address pointer will be increased automatically by one after each data read.

Also, a dummy read is required before the first data read.

To write data to the GDDRAM, select LOW for the R/W# (WR#) pin and HIGH for the D/C# pin for both 6800-series parallel mode and 8080-series parallel mode. The serial interface mode is always in write mode. The GDDRAM column address pointer will be increased automatically by one after each data write.

Table 9-3 : Address increment table (Automatic)

D/C#	R/W# (WR#)	Comment	Address Increment
0	0	Write Command	No
0	1	Read Status	No
1	0	Write Data	Yes
1	1	Read Data	Yes ⁽¹⁾

Note

⁽¹⁾ If read-data command is issued in read-modify-write mode no address increase occurs.

10 COMMAND DESCRIPTIONS

10.1 Fundamental Command

10.1.1 Set Lower Column Start Address for Page Addressing Mode (00h~0Fh)

This command specifies the lower nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Please refer to Section Table 9-1 and Section 10.1.3 for details.

10.1.2 Set Higher Column Start Address for Page Addressing Mode (10h~1Fh)

This command specifies the higher nibble of the 8-bit column start address for the display data RAM under Page Addressing Mode. The column address will be incremented by each data access. Please refer to Section Table 9-1 and Section 10.1.3 for details.

10.1.3 Set Memory Addressing Mode (20h)

There are 3 different memory addressing mode in SSD1305: page addressing mode, horizontal addressing mode and vertical addressing mode. This command sets the way of memory addressing into one of the above three modes. In there, “COL” means the graphic display data RAM column.

Page addressing mode (A[1:0]=10xb)

In page addressing mode, after the display RAM is read/written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is not changed. Users have to set the new page and column addresses in order to access the next page RAM content. The sequence of movement of the PAGE and column address pointer for page addressing mode is shown in Figure 10-1.

Figure 10-1 : Address Pointer Movement of Page addressing mode

	COL0	COL 1	COL 130	COL 131
PAGE0	→				
PAGE1	→				
:	:	:	:	:	:
PAGE6	→				
PAGE7	→				

In normal display data RAM read or write and page addressing mode, the following steps are required to define the starting RAM access pointer location:

- Set the page start address of the target display location by command B0h to B7h.
- Set the lower start column address of pointer by command 00h~0Fh.
- Set the upper start column address of pointer by command 10h~1Fh.

For example, if the page address is set to B2h, lower column address is 03h and upper column address is 10h, then that means the starting column is SEG3 of PAGE2. The RAM access pointer is located as shown in Figure 10-2. The input data byte will be written into RAM position of column 3.

Figure 10-2 : Example of GDDRAM access pointer setting in Page Addressing Mode (No row and column-remapping)

Horizontal addressing mode (A[1:0]=00b)

In horizontal addressing mode, after the display RAM is read/written, the column address pointer is increased automatically by 1. If the column address pointer reaches column end address, the column address pointer is reset to column start address and page address pointer is increased by 1. The sequence of movement of the page and column address point for horizontal addressing mode is shown in Figure 10-3. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-3.)

Figure 10-3 : Address Pointer Movement of Horizontal addressing mode

Vertical addressing mode: (A[1:0]=01b)

In vertical addressing mode, after the display RAM is read/written, the page address pointer is increased automatically by 1. If the page address pointer reaches the page end address, the page address pointer is reset to page start address and column address pointer is increased by 1. The sequence of movement of the page and column address point for vertical addressing mode is shown in Figure 10-4. When both column and page address pointers reach the end address, the pointers are reset to column start address and page start address (Dotted line in Figure 10-4.)

Figure 10-4 : Address Pointer Movement of Vertical addressing mode

In normal display data RAM read or write and horizontal / vertical addressing mode, the following steps are required to define the RAM access pointer location:

- Set the column start and end address of the target display location by command 21h.
- Set the page start and end address of the target display location by command 22h.

Example is shown in Figure 10-5.

10.1.4 Set Column Address (21h)

This triple byte command specifies column start address and end address of the display data RAM. This command also sets the column address pointer to column start address. This pointer is used to define the current read/write column address in graphic display data RAM. If horizontal address increment mode is enabled by command 20h, after finishing read/write one column data, it is incremented automatically to the next column address. Whenever the column address pointer finishes accessing the end column address, it is reset back to start column address and the row address is incremented to the next row.

10.1.5 Set Page Address (22h)

This triple byte command specifies page start address and end address of the display data RAM. This command also sets the page address pointer to page start address. This pointer is used to define the current read/write page address in graphic display data RAM. If vertical address increment mode is enabled by command 20h, after finishing read/write one page data, it is incremented automatically to the next page address. Whenever the page address pointer finishes accessing the end page address, it is reset back to start page address.

The figure below shows the way of column and page address pointer movement through the example: column start address is set to 2 and column end address is set to 129, page start address is set to 1 and page end address is set to 6; Horizontal address increment mode is enabled by command 20h. In this case, the graphic display data RAM column accessible range is from column 2 to column 129 and from page 1 to page 6 only. In addition, the column address pointer is set to 2 and page address pointer is set to 1. After finishing read/write one pixel of data, the column address is increased automatically by 1 to access the next RAM location for next read/write operation (*solid line in Figure 10-5*). Whenever the column address pointer finishes accessing the end column 129, it is reset back to column 2 and page address is automatically increased by 1 (*solid line in Figure 10-5*). While the end page 6 and end column 129 RAM location is accessed, the page address is reset back to 1 and the column address is reset back to 2 (*dotted line in Figure 10-5*). .

Figure 10-5 : Example of Column and Row Address Pointer Movement

10.1.6 Set Display Start Line (40h~7Fh)

This command sets the Display Start Line register to determine starting address of display RAM, by selecting a value from 0 to 63. With value equal to 0, RAM row 0 is mapped to COM0. With value equal to 1, RAM row 1 is mapped to COM0 and so on.

Refer to Table 10-1 for more illustrations.

10.1.7 Set Contrast Control for BANK0 (81h)

This command sets the Contrast Setting of the display. The chip has 256 contrast steps from 00h to FFh. The segment output current increases as the contrast step value increases. See Figure 10-6 below.

Figure 10-6 : Segment current vs Contrast setting

10.1.8 Set Brightness for Area Color Banks (82h)

This command sets the Brightness Setting of the display for the area color banks. The chip has 256 brightness steps from 00h to FFh. The segment output current increases as the brightness step value increases.

This setting does not affect the contrast of BANK0, which is set by command 81h.

10.1.9 Set Look Up Table (LUT) (91h)

The SSD1305 provides 4 color settings - Colors A, B, C and D for the bank color of BANK1 to BANK32 under the area color mode. The color intensity (or grey scale) is defined by the current drive pulse width. This pulse width setting must be stored in the Look Up Table (LUT). The pulse width of colors A, B, C is programmable from 32 to 64 DCLKs. The color D is fixed at 64 DCLKs pulse width. For the grey scale in BANK0, the pulse width is programmable from 32 to 64 DCLKs. Please refer to 91h command in Table 9-1 for details of the LUT setting.

After setting the pulse widths for the color of A, B, C, D and BANK0, the next step is to define the color of each display area. Each bank can be programmable to any one of the 4 colors (A, B, C and D). The user can use 92h and 93h commands for the bank color setting. It should be notice that this is only applicable in area color mode.

10.1.10 Set Bank Color of BANK1 to BANK16 (PAGE0) (92h)

This command maps the bank color (pulse width) of BANK1~BANK16 to any one of the 4 colors: A, B, C and D. For details of the setting, please refer to 92h command in Table 9-1.

10.1.11 Set Bank Color of BANK17 to BANK32 (PAGE0) (93h)

This command maps the bank color (pulse width) of BANK17~BANK32 to any one of the 4 colors: A, B, C and D. For details of the setting, please refer to 93h command in Table 9-1.

10.1.12 Set Segment Re-map (A0h/A1h)

This command changes the mapping between the display data column address and the segment driver. It allows flexibility in OLED module design. Please refer to Table 9-1.

This command only affects subsequent data input. Data already stored in GDDRAM will have no changes.

10.1.13 Entire Display ON (A4h/A5h)

A4h command enable display outputs according to the GDDRAM contents.

If A5h command is issued, then by using A4h command, the display will resume to the GDDRAM contents. In other words, A4h command resumes the display from entire display “ON” stage.

A5h command forces the entire display to be “ON”, regardless of the contents of the display data RAM.

10.1.14 Set Normal/Inverse Display (A6h/A7h)

This command sets the display to be either normal or inverse. In normal display a RAM data of 1 indicates an “ON” pixel while in inverse display a RAM data of 0 indicates an “ON” pixel.

10.1.15 Set Multiplex Ratio (A8h)

This command switches the default 63 multiplex mode to any multiplex ratio, ranging from 16 to 63. The output pads COM0~COM63 will be switched to the corresponding COM signal.

10.1.16 Reserved (AAh)

This command is reserved.

10.1.17 Dim Mode setting (ABh)

This command contains multiple bits to configure the contrast and brightness of color bank for the display in dim mode. The brightness setting of color bank can be set different to normal mode (AFh). The display can be set in dim mode through command ACh.

10.1.18 Master Configuration (ADh)

This command selects the external V_{CC} power supply by default. As external V_{CC} power supply is selected, external V_{CC} power should be connected to the V_{CC} pin.

10.1.19 Set Display ON/OFF (ACh/AEh/AFh)

These single byte commands are used to turn the OLED panel display ON or OFF.

When the display is ON, the selected circuits by Set Master Configuration command will be turned ON.

When the display is OFF, those circuits will be turned OFF and the segment and common output are in high impedance state.

These commands set the display to one of the three states:

- ACh : Dim Mode Display ON
- AEh : Display OFF
- AFh : Normal Brightness Display ON

where the dim mode settings are controlled by command ABh.

Figure 10-7 :Transition between different modes

10.1.20 Set Page Start Address for Page Addressing Mode (B0h~B7h)

This command positions the page start address from 0 to 7 in GDDRAM under Page Addressing Mode. Please refer to Table 9-1 and Section 10.1.3 for details.

10.1.21 Set COM Output Scan Direction (C0h/C8h)

This command sets the scan direction of the COM output, allowing layout flexibility in the OLED module design. Additionally, the display will show once this command is issued. For example, if this command is sent during normal display then the graphic display will be vertically flipped immediately. Please refer to Table 10-3 for details.

10.1.22 Set Display Offset (D3h)

This is a double byte command. The second command specifies the mapping of the display start line to one of COM0~COM63 (assuming that COM0 is the display start line then the display start line register is equal to 0). For example, to move the COM16 towards the COM0 direction by 16 lines the 6-bit data in the second byte should be given as 010000b. To move in the opposite direction by 16 lines the 6-bit data should be given by 64 – 16, so the second byte would be 100000b.

The following two tables (Table 10-1, Table 10-2) show the example of setting the command C0h/C8h and D3h.

Table 10-1 : Example of Set Display Offset and Display Start Line with no Remap

Hardware pin name	Output												Set MUX ratio(A8h) COM Normal / Remapped (C0h / C8h) Display offset (D3h) Display start line (40h - 7Fh)

10.1.23 Set Display Clock Divide Ratio/ Oscillator Frequency (D5h)

This command consists of two functions:

- Display Clock Divide Ratio (D)(A[3:0])
Set the divide ratio to generate DCLK (Display Clock) from CLK. The divide ratio is from 1 to 16, with reset value = 1. Please refer to section 8.3 for the details relationship of DCLK and CLK.
- Oscillator Frequency (A[7:4])
Program the oscillator frequency Fosc that is the source of CLK if CLS pin is pulled high. The 4-bit value results in 16 different frequency settings available as shown below. The default setting is 0111b.

Figure 10-8 : Typical Oscillator frequency adjustment by D5 command ($V_{DD} = 2.8V$)

Note

⁽¹⁾ There is 10% tolerance in the above frequency values

10.1.24 Set Area Color Mode ON/OFF & Low Power Display Mode (D8h)

This command is used to enable area color mode. RESET is monochrome mode. The low power display mode can reduce power consumption during IC operation.

10.1.25 Set Pre-charge Period (D9h)

This command is used to set the duration of the pre-charge period. The interval is counted in number of DCLK, where RESET equals 2 DCLKs.

10.1.26 Set COM Pins Hardware Configuration (DAh)

This command sets the COM signals pin configuration to match the OLED panel hardware layout. The table below shows the COM pin configuration under different conditions (for MUX ratio =64):

Table 10-3 : COM Pins Hardware Configuration

Conditions	COM pins Configurations
<p>1 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh X[5] =0)</p>	 <p>Pad 1,2,3,...->126 Gold Bumps face up</p>
<p>2 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM0 to COM63 (C0h) Enable COM Left/Right remap (DAh X[5] =1)</p>	 <p>Pad 1,2,3,...->126 Gold Bumps face up</p>
<p>3 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Disable COM Left/Right remap (DAh X[5] =0)</p>	 <p>Pad 1,2,3,...->126 Gold Bumps face up</p>

Conditions	COM pins Configurations
<p>4 Sequential COM pin configuration (DAh X[4] =0) COM output Scan direction: from COM63 to COM0 (C8h) Enable COM Left/Right remap (DAh X[5] =1)</p>	
<p>5 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM0 to COM63 (C0h) Disable COM Left/Right remap (DAh X[5] =0)</p>	
<p>6 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM0 to COM63 (C0h) Enable COM Left/Right remap (DAh X[5] =1)</p>	

Conditions	COM pins Configurations
7 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM63 to COM0(C8h) Disable COM Left/Right remap (DAh X[5] =0)	
8 Alternative COM pin configuration (DAh X[4] =1) COM output Scan direction: from COM63 to COM0(C8h) Enable COM Left/Right remap (DAh X[5] =1)	

10.1.27 Set V_{COMH} Deselect Level (DBh)

This command adjusts the V_{COMH} regulator output.

10.1.28 Enter Read Modify Write (E0h)

This single byte command is used to enter the Read Modify Write mode.

During the Read Modify Write mode:

The RAM address pointer will not be incremented when there is data read.

The RAM address pointer will be increased by one automatically after each data write.

After exit the Read Modify Write Mode by command EEh, the RAM address pointer returns back to the original location before enter the Read Modify Write mode.

For instance, when reading the data from the RAM and re-writing a new data to the same location, there is no need to re-enter the column and page addresses again under this mode.

Table 10-4 : Example of Read Modify Write Mode

Condition	RAM & address pointer (under Horizontal addressing mode)
Originally, Address Pointer point to address A	
Enter Read Modify Write Mode by command E0h	
Data read : address pointer does not change	
Data Write: address pointer increases by one automatically after each data write	
Data Write: address pointer increases by one automatically after each data write	
Data read : address pointer does not change	
Data Write: address pointer increases by one automatically after each data write	
Exit Read Modify Write Mode by command EEh	
Address Pointer point to address A after exit Read Modify Write Mode	

10.1.29 NOP (E3h)

No Operation Command

10.1.30 Exit Read Modify Write (EEh)

This single byte command is used to exit the Read Modify Write mode (Please refer to Section 10.1.28. for details of the Read Modify Write Mode).

10.1.31 Status register Read

This command is issued by setting D/C# ON LOW during a data read (See Figure 13-1 to Figure 13-3 for parallel interface waveform). It allows the MCU to monitor the internal status of the chip. No status read is provided for serial mode.

10.2 Graphic Acceleration Command

10.2.1 Horizontal Scroll Setup (26h/27h)

This command consists of 5 consecutive bytes to set up the horizontal scroll parameters and determines the scrolling start page, end page and scrolling speed.

Before issuing this command the horizontal scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted.

The SSD1305 horizontal scroll is designed for 132 columns scrolling. The following three figures (Figure 10-9, Figure 10-10, Figure 10-11) show the examples of using the horizontal scroll:

Figure 10-9 : Horizontal scroll example: Scroll RIGHT by 4 columns

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	SEG126	SEG127	SEG128	SEG129	SEG130	SEG131
After one scroll step	SEG128	SEG129	SEG130	SEG131	SEG0	SEG1	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127

Figure 10-10 : Horizontal scroll example: Scroll LEFT by 2 columns

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	SEG126	SEG127	SEG128	SEG129	SEG130	SEG131
After one scroll step	SEG2	SEG3	SEG4	SEG5	SEG6	SEG7	SEG128	SEG129	SEG130	SEG131	SEG0	SEG1

Figure 10-11 : Horizontal scrolling setup example

10.2.2 Continuous Vertical and Horizontal Scroll Setup (29h/2Ah)

This command consists of 6 consecutive bytes to set up the continuous vertical and horizontal scroll parameters and determines the scrolling start page, end page, scrolling speed and vertical scrolling offset.

The bytes A[2:0], B[2:0], C[2:0] and D[2:0] of command 29h/2Ah are for the setting of the continuous horizontal scrolling. The byte E[5:0] is for the setting of the continuous vertical scrolling offset. All these bytes together are for the setting of continuous diagonal (horizontal + vertical) scrolling. If the vertical scrolling offset byte E[5:0] is set to zero, then only horizontal scrolling is performed (like command 26/27h). Alternatively, if the byte A[2:0] is set to zero and E[5:0] is not set to zero, then only vertical scrolling is performed.

Before issuing this command the scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted. The following two figures (Figure 10-12 , Figure 10-13) show the examples of using the continuous vertical and horizontal scroll:

Figure 10-12 : Continuous Vertical and Horizontal scrolling setup examples

Figure 10-13 : Continuous Vertical and Horizontal scrolling example: With setting in MUX ratio

As shown in Figure 10-13, the whole RAM content is displayed during scrolling regardless of the MUX ratio.

10.2.3 Deactivate Scroll (2Eh)

This command stops the motion of scrolling. After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.

10.2.4 Activate Scroll (2Fh)

This command starts the motion of scrolling and should only be issued after the scroll setup parameters have been defined by the scrolling setup commands :26h/27h/29h/2Ah . The setting in the last scrolling setup command overwrites the setting in the previous scrolling setup commands.

The following actions are prohibited after the scrolling is activated

1. RAM access (Data write or read)
2. Changing the horizontal scroll setup parameters

10.2.5 Set Vertical Scroll Area(A3h)

This command consists of 3 consecutive bytes to set up the vertical scroll area. For the continuous vertical scroll function (command 29/2Ah), the number of rows that in vertical scrolling can be set smaller or equal to the MUX ratio. Figure 10-14 shows some vertical scrolling example with different settings in vertical scroll area.

Figure 10-14 : Vertical scroll area setup examples

Display before vertical scrolling start	Display snap shot after vertical scrolling start	
	<p>No. of rows in top fixed area =0 (POR)</p> <p>No. of rows in scroll area=64 (POR)</p> 	<p>Example 1 : Full screen vertical scrolling with 1 row up in every 6 frames</p> <p>Sample code 29h // Vertical and right horizontal scroll 00h // No horizontal scroll 00h // Dummy byte for start page address 00h // Set time interval between each scroll step as 6 frames 00h // Dummy byte for end page address 01h // Set vertical scrolling offset as 1 row 2Fh // Activate scrolling</p>
	<p>No. of rows in top fixed area=0</p> <p>No. of rows in scroll area=40</p> 	<p>Example 2 : Partial screen (top area) vertical scrolling with 1 row up in every 32 frames</p> <p>Sample code A3h // Set Vertical Scroll Area 00h // Set 0 row in top fixed area 28h // Set 40 rows in scroll area 29h // Vertical and right horizontal scroll 00h // No horizontal scroll 00h // Dummy byte for start page address 01h // Set time interval between each scroll step as 32 frames 00h // Dummy byte for end page address 01h // Set vertical scrolling offset as 1 row 2Fh // Activate scrolling</p>
	<p>No. of rows in top fixed area=40</p> <p>No. of rows in scroll area=24</p> 	<p>Example 3 : Partial screen (bottom area) vertical scrolling with 1 row up in every 6 frames</p> <p>Sample code A3h // Set Vertical Scroll Area 28h // Set 40 rows in top fixed area 18h // Set 24 rows in scroll area 29h // Vertical and right horizontal scroll 00h // No horizontal scroll 00h // Dummy byte for start page address 00h // Set time interval between each scroll step as 6 frames 00h // Dummy byte for end page address 01h // Set vertical scrolling offset as 1 row 2Fh // Activate scrolling</p>
	<p>No. of rows in top fixed area=32</p> <p>No. of rows in scroll area=24</p> 	<p>Example 4 : Partial screen (central area) vertical scrolling with 1 row up in every 3 frames</p> <p>Sample code A3h // Set Vertical Scroll Area 20h // Set 32 rows in top fixed area 18h // Set 24 rows in scroll area 29h // Vertical and right horizontal scroll 00h // No horizontal scroll 00h // Dummy byte for start page address 04h // Set time interval between each scroll step as 3 frames 00h // Dummy byte for end page address 01h // Set vertical scrolling offset as 1 row 2Fh // Activate scrolling</p>

11 MAXIMUM RATINGS

Table 11-1 : Maximum Ratings (Voltage Referenced to V_{SS})

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	-0.3 to +4	V
V_{DDIO}		-0.3 to $V_{DD}+0.5$	V
V_{CC}		0 to 16	V
V_{SEG}	SEG output voltage	0 to V_{CC}	V
V_{COM}	COM output voltage	0 to $0.9 \cdot V_{CC}$	V
V_{in}	Input voltage	$V_{SS}-0.3$ to $V_{DD}+0.3$	V
T_A	Operating Temperature	-40 to +85	°C
T_{stg}	Storage Temperature Range	-65 to +150	°C

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section

This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

12 DC CHARACTERISTICS

Condition (Unless otherwise specified):

Voltage referenced to V_{SS}

$V_{DD} = 2.4$ to $3.5V$

$T_A = 25^\circ C$

Table 12-1 : DC Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
V_{CC}	Operating Voltage	-	7	-	15	V
V_{DD}	Logic Supply Voltage	-	2.4	-	3.5	V
V_{DDIO}	Logic Supply Voltage for MCU interface	-	1.6	-	V_{DD}	V
V_{OH}	High Logic Output Level	$I_{OUT} = 100\mu A, 3.3MHz$	$0.9 \times V_{DDIO}$	-	-	V

14 APPLICATION EXAMPLE

Figure 14-1 : Application Example of SSD1305T6R1

The configuration for 6800-parallel interface mode, external V_{CC} is shown in the following diagram:
 ($V_{DD}=2.7V$, $V_{CC}=12V$, $I_{REF}=10\mu A$)

Pin connected to MCU interface: D[7:0], E, R/W#, D/C#, CS#, RES#
 Pin internally connected to V_{SS} : BS0, V_{SSB}
 GDR, V_{BREF} , FB should be left open.

- C1: 4.7 μ F ⁽¹⁾
- C2: 4.7 μ F ⁽¹⁾
- C3: 4.7 μ F ⁽¹⁾
- C4: 4.7 μ F ⁽¹⁾

R1: 910k Ω , $R1 = (\text{Voltage at } I_{REF} \text{ pin} - V_{SS}) / I_{REF}$
 Voltage at I_{REF} pin = $V_{CC} - 3V$

Note

⁽¹⁾ The capacitor value is recommended value. Select appropriate value against module application.
