### 7-3) Panel AC Characteristics

#### 7-3-1) MCU Interface

##### 7-3-1-1) MCU Interface Selection

In this module, there are 4-wire SPI and 3-wire SPI that can communicate with MCU. The MCU interface mode can be set by hardware selection on BS1 pins. When it is “Low”, 4-wire SPI is selected. When it is “High”, 3-wire SPI (9 bits SPI) is selected.

Pin Name	Data/Command Interface		Control Signal		
	D1	D0	CS#	D/C#	RES#
Bus interface	D1	D0	CS#	D/C#	RES#
SPI4	SDin	SCLK	CS#	D/C#	RES#
SPI3	SDin	SCLK	CS#	L	RES#

**Table 7-1: MCU interface assignment under different bus interface mode**

Note 7-2: L is connected to VSS

Note 7-3: H is connected to VCI

### 7-3-1-2) MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCLK, serial data SDIN, D/C#, CS#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN.

Function	CS#	D/C#	SCLK
Write Command	L	L	↑
Write data	L	H	↑

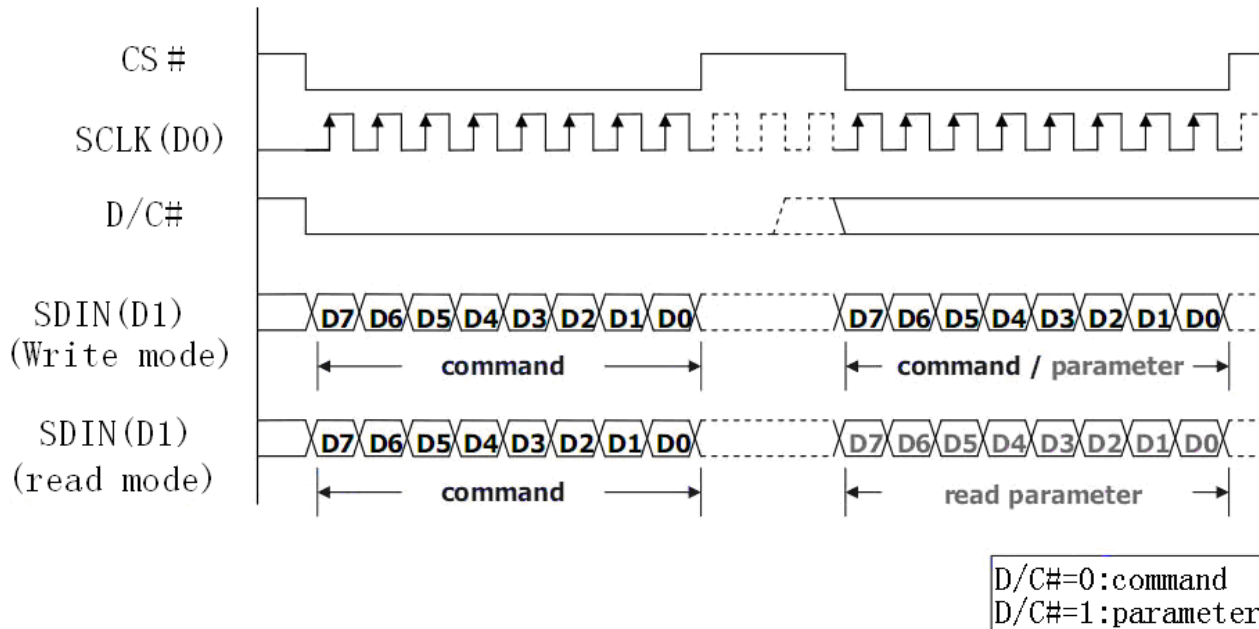

**Table 7-2: Control pins of 4-wire Serial Peripheral interface**

**Note 7-9:** ↑stands for rising edge of signal

SDIN is shifted into an 8-bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock.

Under serial mode, only write operations are allowed.

**D/C# keeps the same value during the whole 8-bit cycles.**

### 7-3-1-3) MCU Serial Interface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data SDIN and CS#.

In 3-wire SPI mode, D0 acts as SCLK, D1 acts as SDIN, The pin D/C# can be connected to an external ground.

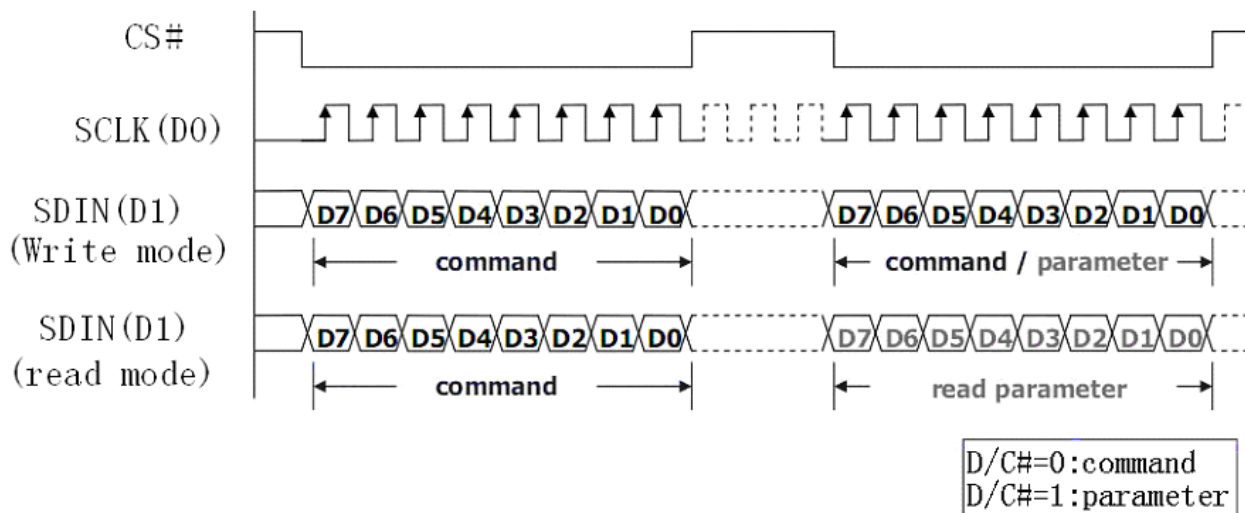

The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0). Under serial mode, only write operations are allowed.

Function	CS#	D/C#	SCLK
Write Command	L	Tie LOW	↑
Write data	L	Tie LOW	↑

## WAVEFORM LUT CONTROL SOFTWARE

---

For every bunch of EPD the waveform data is different, so you may receive the waveform LUT from CrystalFontz. You just need to use the follow sequence to download the waveform into driver IC.

sequence	command	Action Description	remark
1	04	Power on	Send cmd 04
2	20	VCOM LUT Setting	Send cmd 20 data lut_vcom0[]
3	21	White LUT Setting	Send cmd 21 data lut_w[]
4	22	Black LUT Setting	Send cmd 22 data lut_b[]

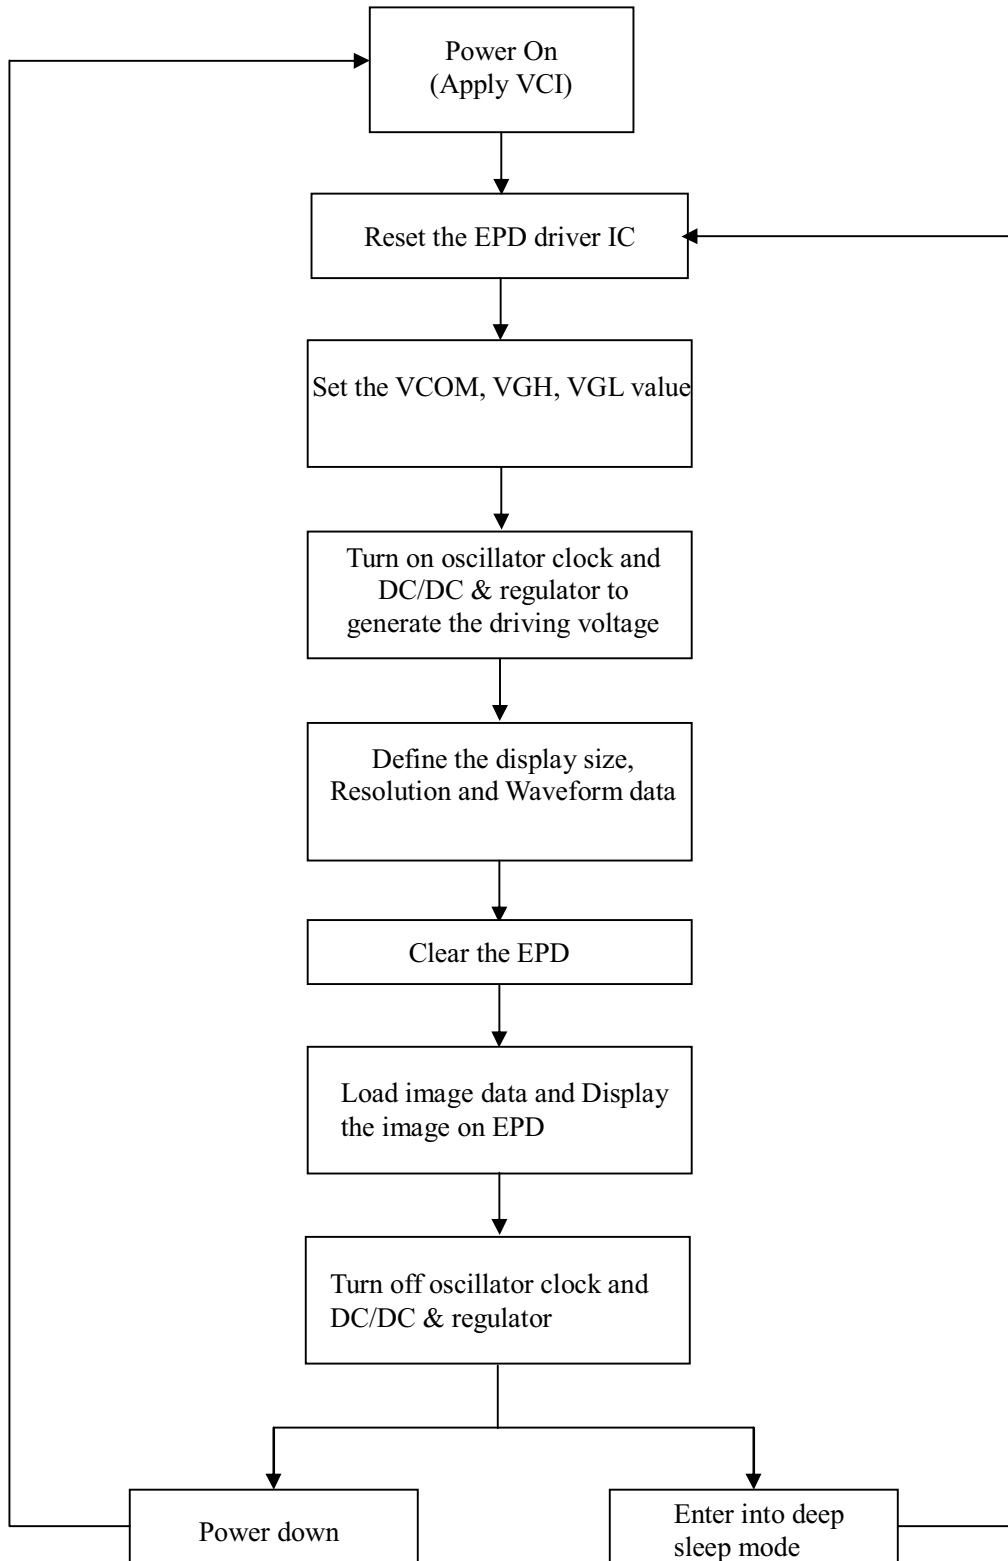

Note: To download the waveform into driver ic, you must send command 04 first, then send 20, 21, 22 command.

The data of lut\_vcom0[], lut\_w[], lut\_b[], each batch of EPD is different.

For maximum performance, each batch of EDP has a unique LUT. Contact Technical Support to make sure you have the correct LUT for the batch that your displays were produced in.

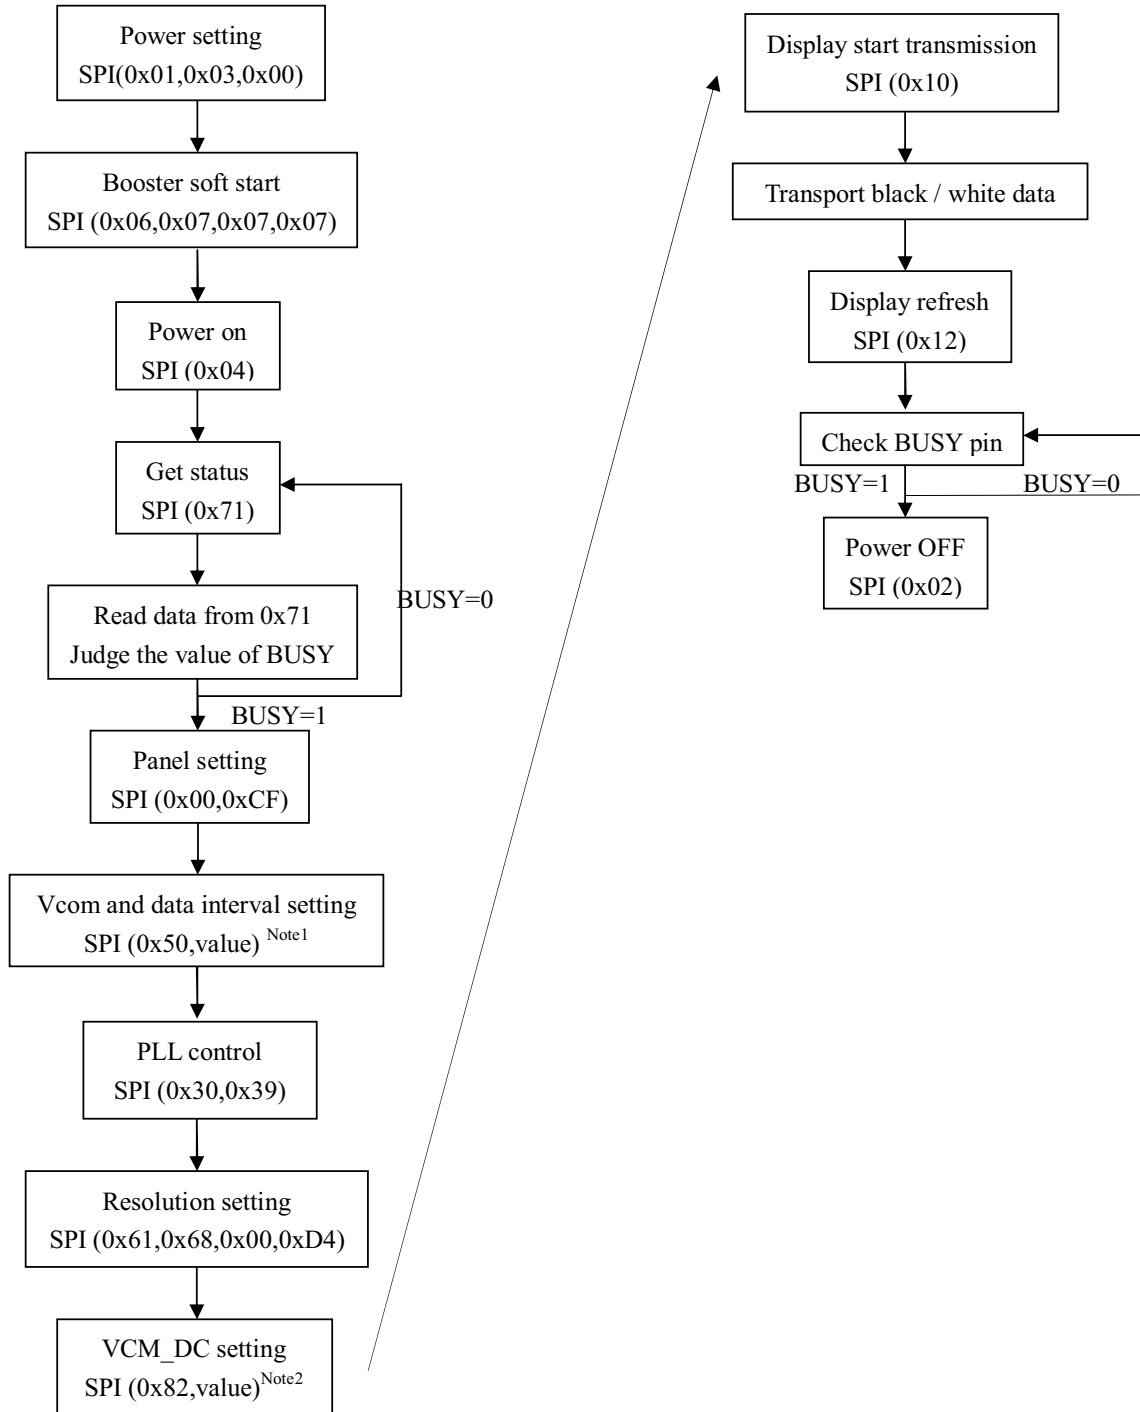

## TYPICAL OPERATION SEQUENCE, NORMAL FLOW

## REFERENCE PROGRAM CODE

Note1: When value=0x57, border will be drive to black after refresh. When value=0x17, the border is set to floating.

Note2: Different EPD with different VCOM value, CFA will provide different values according to different batches of EPD.

## 10-1) Specifications

Measurements are made with that the illumination is under an angle of 45 degrees, the detection is perpendicular unless otherwise specified.

Note 10-2: When work in temperature below 0 degree or above 40 degree, we do not recommend because the panel's life will not be guaranteed.

## 10-2) Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd) :

R1: white reflectance      Rd: dark reflectance

$$CR = R1/Rd$$

### 10-3) Reflection Ratio

The reflection ratio is expressed as:

$$R = \text{Reflectance Factor}_{\text{white board}} \times (L_{\text{center}} / L_{\text{white board}})$$

$L_{\text{center}}$  is the luminance measured at center in a white area ( $R=G=B=1$ ).  $L_{\text{white board}}$  is the luminance of a standard white board. Both are measured with equivalent illumination source. The viewing angle shall be no more than 2 degrees.

### 10-4) Bi-stability

The Bi-stability standard as follows:

Bi-stability	Result		
		AVG	MAX
24 hours Luminance drift	White state $\Delta L^*$	-	3
	Black state $\Delta L^*$	-	3
