ST7556

65 x 102 Dot Matrix LCD Controller/Driver

1. INTRODUCTION

The ST7556 is a driver & controller LSI for graphic dot-matrix liquid crystal display systems. It contains 102 segment and 65 common with 1 ICOM driver circuits. This chip is connected directly to a microprocessor, accepts 4-line serial interface (SPI) or 8-bit parallel interface, display data can store in an on-chip display data RAM of 66 x 102 bits. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits to drive liquid crystal, it is possible to make a display system with the fewest components.

2. FEATURES

Driver Output Circuits

102 segment outputs / 65+1 common outputs

On-chip Display Data ram

- Capacity: 66X102=6,732 bits

Microprocessor Interface

- 8-bit parallel bi-directional interface with 6800-series or 8080-series
- 4-line SPI (serial peripheral interface) available (only write operation)

On-chip Low Power Analog Circuit

- Generation of LCD supply voltage (externally Vout voltage supply is possible)
- Generation of intermediate LCD bias voltages
- Oscillator requires no external components (external clock also possible)
- Voltage converter (x4)
- Voltage regulator (temperature gradient -0.05%/°C)
- Voltage follower
- On-chip electronic contrast control function (128 steps)
- Liquid crystal driving voltage : V0 -VSS = max 12 V (external power supply)

External RESB (reset) pin

Logic supply voltage range V_{DD} -V_{SS}

- 1.8 to 3.3V

Temperature range: -30 to +85 degree

3. PAD Arrangement (COG)

Chip Size: 10,310 um × 1,150 um

Bump Pitch:

PAD NO 1 ~ 148 , 250 ~ 272 : 75.5 um (com/seg) PAD NO 149 ~ 248 : 75 um (I/O) PAD NO 148 ~ 149 : 114 um

PAD NO 248 ~ 249 : 93.5 um (Reset) PAD NO 249 ~ 250 : 95.9 um (Reset)

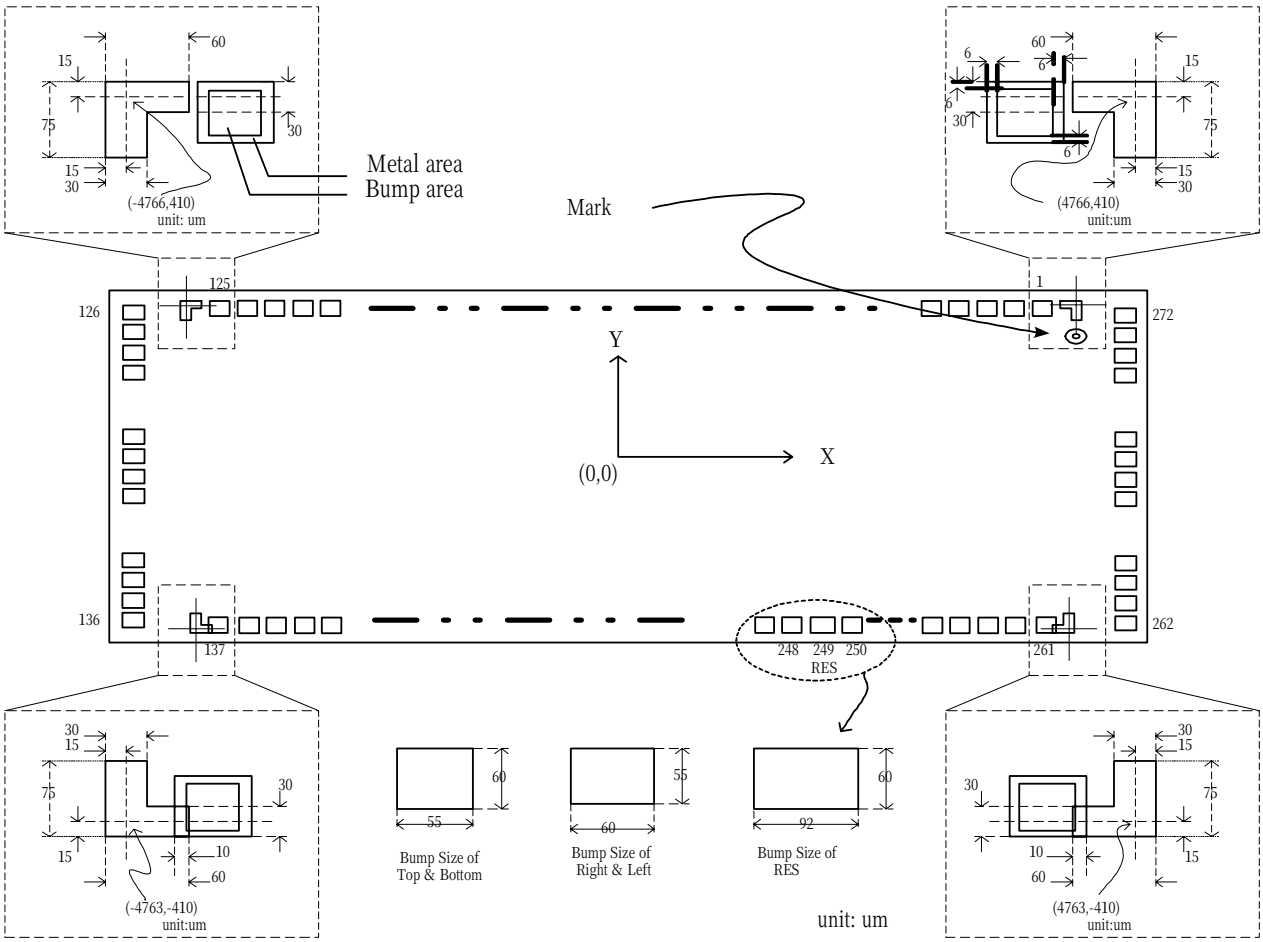
Bump Size:

PAD NO 1 ~ 125 , 137 ~ 248 , 250 ~ 261 : 55(x) um ᚷ 60(y) um PAD NO 249 : 92(x) um ᚷ 60(y) um

PAD NO 126 ~ 136 , 262 ~ 272 : 60(x)um ᚷ 55(y) um

Bump Height: 17 um

Chip Thickness: 635 um



Pad Center Coordinates (NORMAL, TMY=0)

6. FUNCTIONS DESCRIPTION

MICROPROCESSOR INTERFACE

Chip Select Input

There is CSB pin for chip selection. The ST7556 can interface with an MPU when CSB is "L". When CSB is “H”, these pins are set to any other combination, A0, /RD(E), and /WR(R/W) inputs are disabled and D0 to D7 are to be high impedance. And, in case of serial interface, the internal shift register and the counter are reset.

Parallel / Serial Interface

ST7556 has three types of interface with an MPU, which are one serial and two parallel interfaces. This parallel or serial interface is determined by P/S pin as shown in table 1.

Table 1. Parallel/Serial Interface Mode

Type	P/S	IMS	CSB	Interface mode
Parallel	H	H	CSB	6800-series MPU interface
		L		8080-series MPU interface
Serial	L	H	CSB	4-pin SPI interface
		L	---	Do not use

Parallel Interface (P/S = "H")

The 8-bit bi-directional data bus is used in parallel interface and the type of MPU is selected by IMS as shown in table 2. The type of data transfer is determined by signals at A0, /RD (E) and /WR(R/W) as shown in table 3.

Table 2. Microprocessor Selection for Parallel Interface

IMS	CSB	A0	/RD (E)	/WR (R/W)	DB0 to DB7	MPU bus
H	CSB	A0	E	R/W	DB0 to DB7	6800-series
L	CSB	A0	/RD	/WR	DB0 to DB7	8080-series

Table 3. Parallel Data Transfer

Common	6800-series		8080-series		Description
RS	E (/RD)	R/W (/WR)	/RD (E)	/WR (R/W)	
H	H	H	L	H	Display data read out
H	H	L	H	L	Display data write
L	H	H	L	H	Register status read
L	H	L	H	L	Writes to internal register (instruction)

NOTE: When /RD (E) pin is always pulled high for 6800-series interface, it can be used CSB for enable signal. In this case, interface data is latched at the rising edge of CSB and the type of data transfer is determined by signals at A0, /WR(R/W) as in case of 6800-series mode.

Serial Interface (P/S=" L ")

Serial Mode	P/S	IMS	CSB	A0	Description
4-line SPI interface	L	H	CSB	Used	Write only

IMS=” L “, P/S=” H “: 4-line SPI interface

When the ST7556 is active (CSB=”L”), serial data (D6) and serial clock (D7) inputs are enabled. And not active, the internal 8-bit shift register and the 3-bit counter are reset. The display data/command indication may be controlled either via software or the Register Select (A0) Pin, based on the setting of P/S. When the A0 pin is used (IMS = “H”), data is display data when A0 is high, and command data when A0 is low. When A0 is not used (IMS = “L”), the LCD Driver will receive command from MCU by default. If messages on the data pin are data rather than command, MCU should send Data direction command to control the data direction and then one more command to define the number of data bytes will be write. After these two continuous commands are sending, the following messages will be data rather than command. Serial data can be read on the rising edge of serial clock going into D7 and processed as 8-bit parallel data on the eighth serial clock. And the DDRAM column address pointer will be increased by one automatically. The next bytes after the display data string are handled as command data.

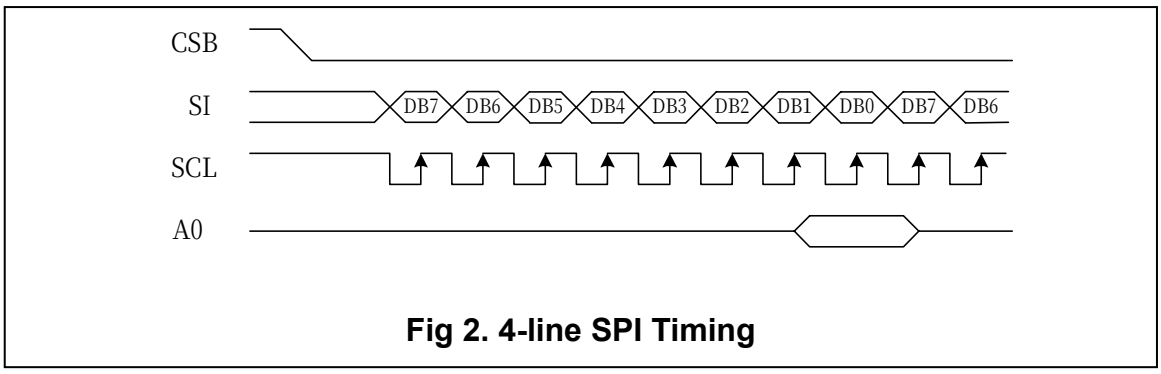

Fig 2. 4-line SPI Timing

Busy Flag

The Busy Flag indicates whether the ST7556 is operating or not. When D7 is "H" in read status operation, this device is in busy status and will accept only read status instruction. If the cycle time is correct, the microprocessor needs not to check this flag before each instruction, which improves the MPU performance.

Data Transfer

The ST7556 uses bus holder and internal data bus for data transfer with the MPU. When writing data from the MPU to on-chip RAM, data is automatically transferred from the bus holder to the RAM as shown in figure 3. And when reading data from on-chip RAM to the MPU, the data for the initial read cycle is stored in the bus holder (dummy read) and the MPU reads this stored data from bus holder for the next data read cycle as shown in figure 4. This means that a dummy read cycle must be inserted between each pair of address sets when a sequence of address sets is executed. Therefore, the data of the specified address cannot be output with the read display data instruction right after the address sets, but can be output at the second read of data.

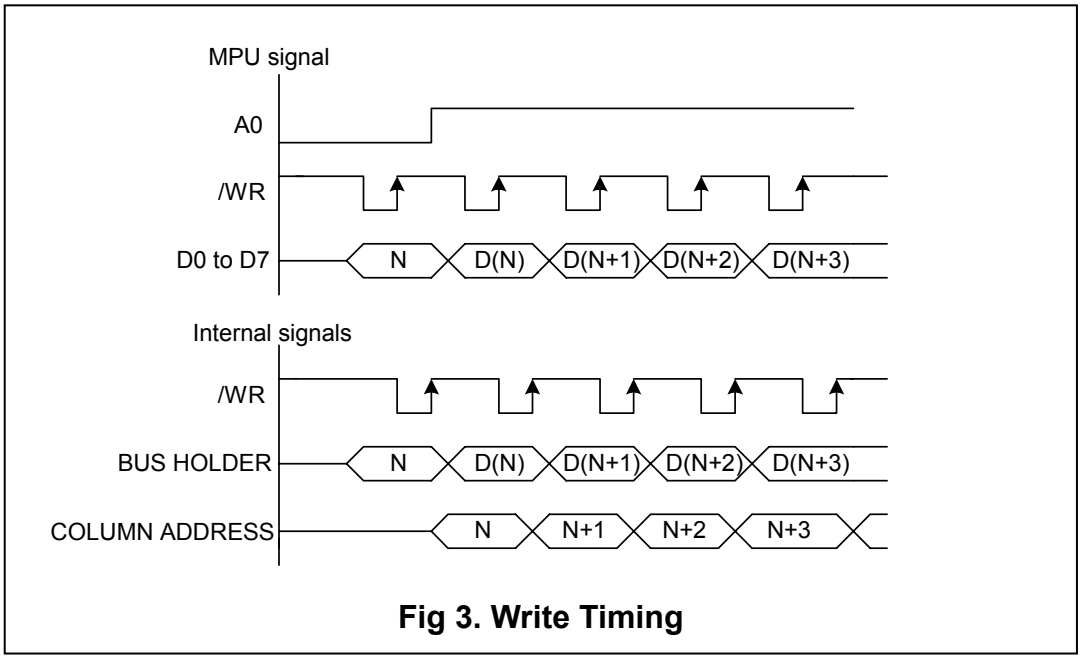

Fig 3. Write Timing

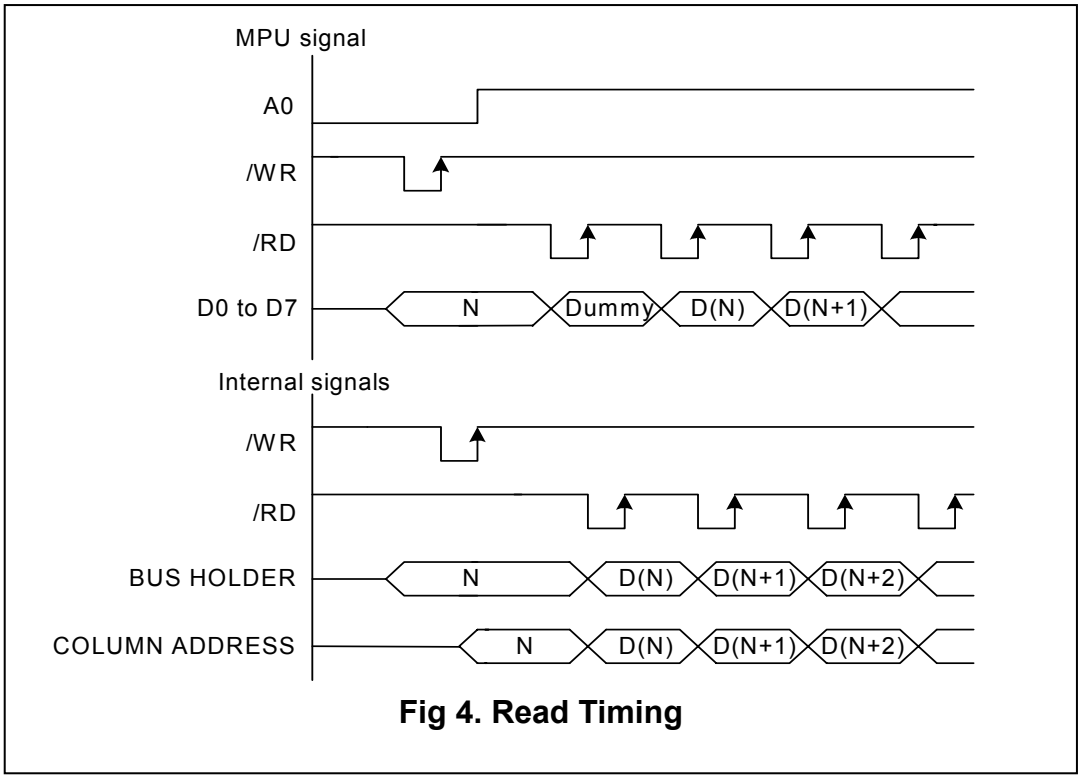

Fig 4. Read Timing

DISPLAY DATA RAM (DDRAM)

The ST7556 contains a 65X102 bit static RAM that stores the display data. The display data RAM store the dot data for the LCD. It has a 65(8 pageX8 +1) X102, and extra ICOM. There is a direct correspondence between X-address and column output number. It is 65-row by 102-column addressable array. Each pixel can be selected when the page and column addresses are specified. The 65 rows are divided into 8 pages of 8 lines and 1 page of 1 line. Data is read from or written to the 8 lines of each page directly through D0 to D7. The display data of D0 to D7 from the microprocessor correspond to the LCD common lines. The microprocessor can read from and write to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written into RAM at the same time as data is being displayed without causing the LCD flicker.

Page Address Circuit

This circuit is for providing a Page Address to Display Data RAM shown in figure 6. It incorporates 4-bit Page Address register changed by only the “Set Page” instruction. Page Address 9 is a special RAM area for the icons and display data D0 is only valid.

Column Address Circuit

Column Address Circuit has an 8-bit preset counter that provides Column Address to the Display Data RAM as shown in figure 5. The display data RAM column address is specified by the Column Address Set command. The specified column address is incremented (+1) with each display data read/write command. This allows the MPU display data to be accessed continuously.

ADDRESSING

Data is downloaded in bytes into the RAM matrix of ST7556 as indicated in Figs.5, 6, 7. The display RAM has a matrix of 65 by 102 bits. The address pointer addresses the columns. The address ranges are: X 0 to 101 (1100101), Y 0 to 8 (1000). Addresses outside these ranges are not allowed.

In vertical addressing mode (V=1) the Y address increments after each byte (see Fig.7). After the last Y address (Y = 8) Y wraps around to 0 and X increments to address the next column.

In horizontal addressing mode (V=0) the X address increments after each byte (see Fig.6). After the last X address (X = 101) X wraps around to 0 and Y increments to address the next row.

After the very last address (X = 101, Y = 8) the address pointers wrap around to address (X = 0, Y =0)

Display Data RAM Map (65 COM + ICOM)

Oscillator

The on-chip oscillator provides the clock signal for the display system. No external components are required and the OSC input must be connected to VDD. An external clock signal, if used, is connected to this input.

Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, CL (internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 102-bit display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M) which enables the LCD driver to make a AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. Driving waveform and internal timing signal are shown in Figure 8.

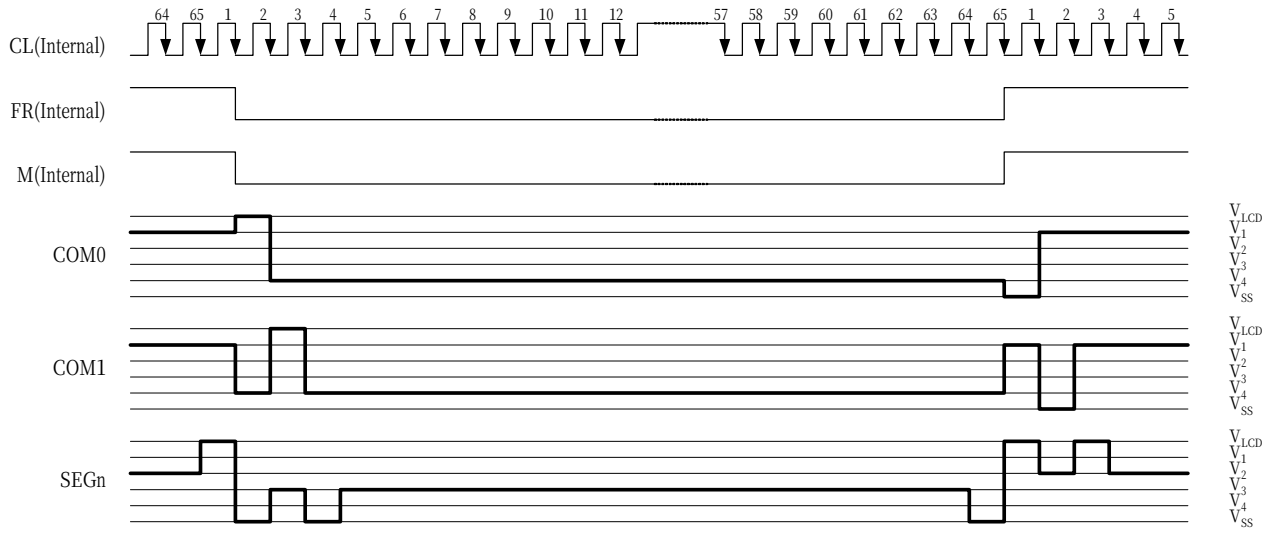

Fig 8. 2-frame AC Driving Waveform (Duty Ratio: 1/65)

7. RESET CIRCUIT

Setting RESB to “L” or Reset instruction can initialize internal function.
When RESB becomes “L”, following procedure is executed
Page address: 0
Column address: 0
Oscillator: OFF
Power down mode (PD = 1)
Horizontal addressing (V = 0)
normal instruction set (H = 0)
Display OFF (D = E = 0)
Address counter X [6:0] = 0, Y [2:0] = 0
Bias system (BS [2:0] = 0)
VLCD is equal to 0; the HV generator is switched off (VOP [6:0] = 0)
After power-on, RAM data are undefined

While RESB is “L” or reset instruction is executed, no instruction except read status can be accepted. Reset status appears at DB6. After DB6 becomes ”L”, any instruction can be accepted. RESB must be connected to the reset pin of the MPU, and initialize the MPU and this LSI at the same time. The initialization by RESB is essential before used.

9. INSTRUCTION DESCRIPTION

H=”0” or “1”

Reset

This instruction resets initial display line, column address, page address, and common output status select to their initial status. This instruction cannot initialize the LCD power supply, which is initialized by the RESB pin.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	1	1

Function Set

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	0	PD	V	H

Flag	Description
PD	All LCD outputs at VSS (display off), bias generator and VLCD generator off, VLCD can be disconnected, oscillator off (external clock possible), RAM contents not cleared; RAM data can be written. PD=0:chip is active PD=1:chip is in power down mode
V	When V = 0, the horizontal addressing is selected. The data is written into the DDRAM as shown in Fig13. When V = 1, the vertical addressing is selected. The data is written into the DDRAM as shown in Fig12
H	When H = 0 the commands ‘display control’, ‘set Y address’ and ‘set X address’ can be performed, when H = 1 the others can be executed. The commands ‘write data’ and ‘function set’ can be executed in both cases. H=0:use basic instruction set H=1:use extended instruction set

Read status byte

Indicates the internal status of the ST7556

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
0	1	PD	RST	BUSY	D	E	1	0	1

Flag			Description
PD			PD=0:chip is active PD=1:chip is in power down mode
RST			Indicates the initialization is in progress by RESET signal 0: chip is active,1:chip is being reset
BUSY			The device is busy when internal operation or reset. Any instruction is rejected until BUSY goes LOW. 0:chip is active;1:chip is being busy
D,E	D	E	The bits D and E select the display mode.
	0	0	Display blank
	0	1	All display segments on
	1	0	Normal mode
	1	1	Inverse video mode
D2~D0			ST7556 will return the fix data “101” as identification bit

Write data

8-bit data of Display Data from the microprocessor can be written to the RAM location specified by the column address and page address. The column address is increased by 1 automatically so that the microprocessor can continuously write data to the addressed page. During auto-increment, the column address wraps to 0 after the last column is written.

A0	WR(R/W)	D7	D6	D5	D4	D3	D2	D1	D0
1	0	Write data							

H=”0”

Display Control

This bits D and E selects the display mode.

Fig 13. V_{OP} programming of ST7556

Caution

As the programming range for the internally generated VLCDIN allows values above the max allowed VLCDIN, the customer has to ensure while setting the VOP register that under all condition and including all tolerances the VLCD limit of max. 13V will never be exceeded. As VLCDIN increases with lower temperatures, care must be taken not to set a Vop generating a VLCDIN voltage that will exceed the maximum of 10.6V when operating at – 30 ℃.

*8,9It indicates the current consumed on ICs alone when the internal oscillator circuit and display are turned on.

13. TIMING CHARACTERISTICS

System Bus Read/Write Characteristics 1 (For the 8080 Series MPU)

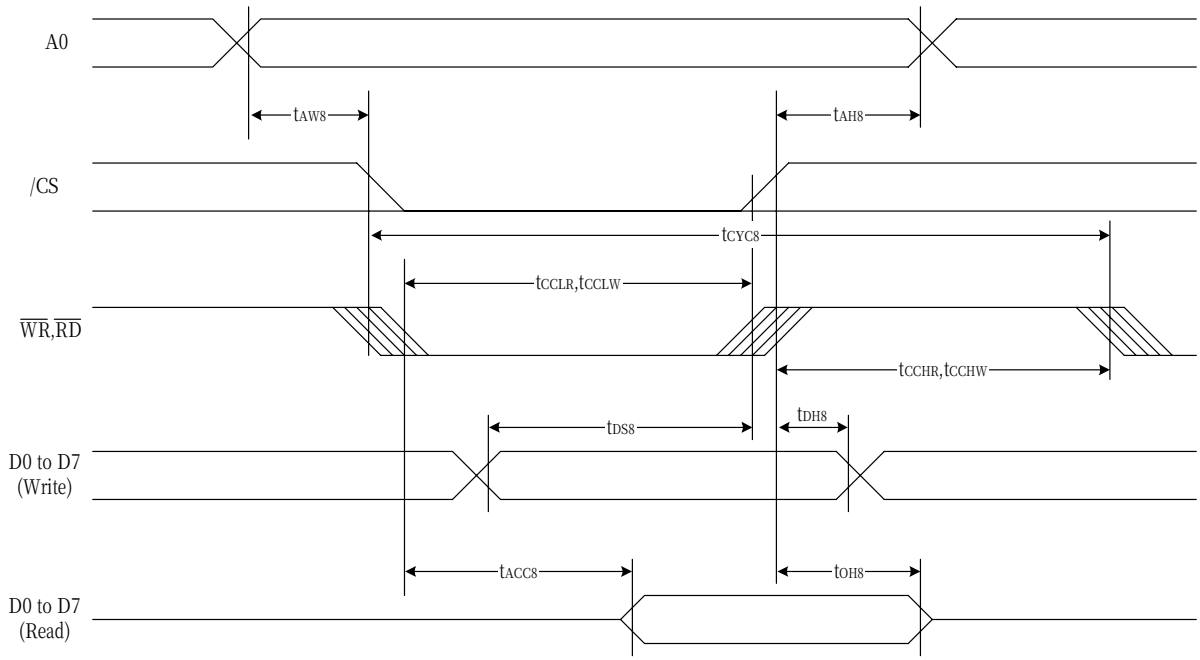

Figure 18.

(VDD = 3.3V , Ta =-30~85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH8		10	—	ns
Address setup time		tAW8		0	—	
System cycle time		tCYC8		240	—	
Enable L pulse width (WRITE)	WR	tCCLW		80	—	
Enable H pulse width (WRITE)		tCCHW		80	—	
Enable L pulse width (READ)	RD	tCCLR		140	—	
Enable H pulse width (READ)		tCCHR		80		
WRITE Data setup time	D0 to D7	tDS8		40	—	
WRITE Address hold time		tDH8		0	—	
READ access time		tACC8	CL = 100 pF	—	70	
READ Output disable time		tOH8	CL = 100 pF	5	50	

(VDD = 2.7 V , Ta = 30~85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH8		15	—	ns
Address setup time		tAW8		0	—	
System cycle time		tCYC8		400	—	
Enable L pulse width (WRITE)	WR	tCCLW		220	—	
Enable H pulse width (WRITE)		tCCHW		180	—	
Enable L pulse width (READ)	RD	tCCLR		220	—	
Enable H pulse width (READ)		tCCHR		180	—	
WRITE Data setup time	D0 to D7	tDS8		40	—	
WRITE Address hold time		tDH8		0	—	
READ access time		tACC8	CL = 100 pF	—	140	
READ Output disable time		tOH8	CL = 100 pF	10	100	

(VDD = 1.8V , Ta = 30~85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH8		30	—	ns
Address setup time		tAW8		0	—	
System cycle time		tCYC8		640	—	
Enable L pulse width (WRITE)	WR	tCCLW		360	—	
Enable H pulse width (WRITE)		tCCHW		280	—	
Enable L pulse width (READ)	RD	tCCLR		360	—	
Enable H pulse width (READ)		tCCHR		280		
WRITE Data setup time	D0 to D7	tDS8		80	—	
WRITE Address hold time		tDH8		30	—	
READ access time		tACC8	CL = 100 pF	—	240	
READ Output disable time		tOH8	CL = 100 pF	10	200	

*1 The input signal rise time and fall time (tr, tf) is specified at 15 ns or less. When the system cycle time is extremely fast, (tr +tf) $\leqq$ (tCYC8 – tCCLW – tCCHW) for (tr + tf) $\leqq$ (tCYC8 – tCCLR – tCCHR) are specified.

*2 All timing is specified using 20% and 80% of VDD as the reference.

*3 tCCLW and tCCLR are specified as the overlap between CSB being “L” and WR and RD being at the “L” level.

System Bus Read/Write Characteristics 1 (For the 6800 Series MPU)

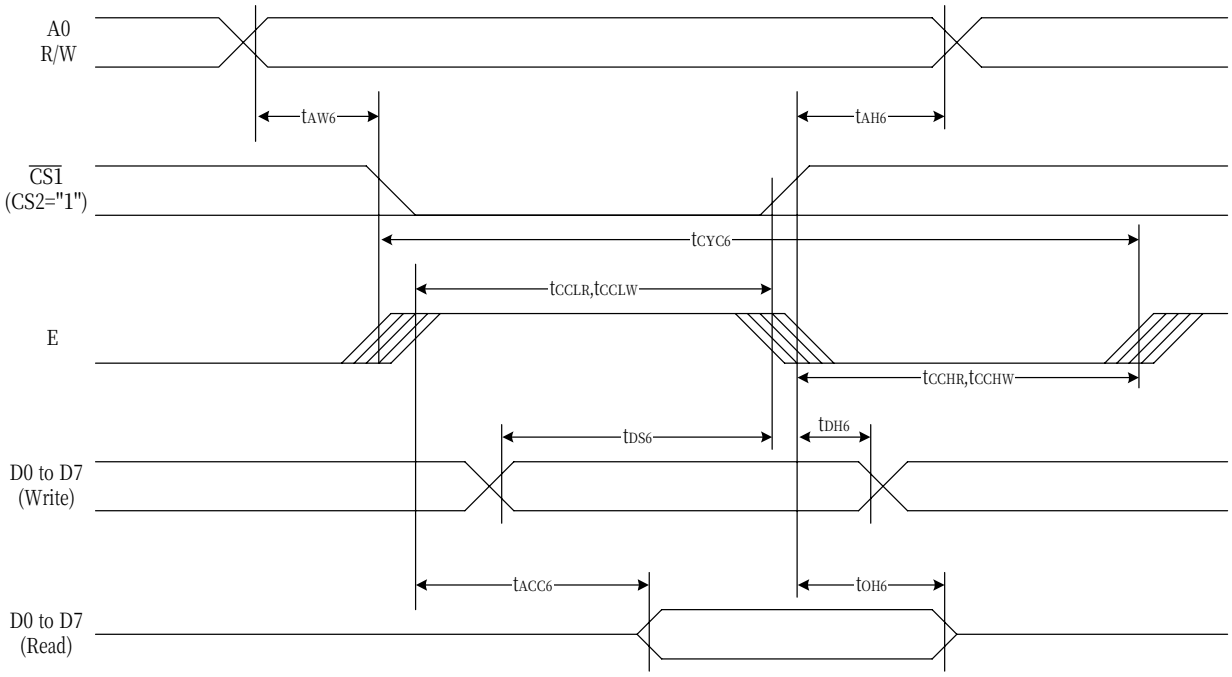

Figure 19.

(V_{DD} = 3.3 V , Ta = 30~85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH6		10	—	ns
Address setup time		tAW6		0	—	
System cycle time		tCYC6		240	—	
Enable L pulse width (WRITE)	WR	tEWLW		80	—	
Enable H pulse width (WRITE)		tEWHW		80	—	
Enable L pulse width (READ)	RD	tEWLR		80	—	
Enable H pulse width (READ)		tEWHR		140		
WRITE Data setup time	D0 to D7	tDS6		40	—	
WRITE Address hold time		tDH6		0	—	
READ access time		tACC6	CL = 100 pF	—	70	
READ Output disable time		tOH6	CL = 100 pF	5	50	

(VDD = 2.7V , Ta =30~85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Address hold time	A0	tAH6		15	—	ns
Address setup time		tAW6		0	—

Data hold time		tSDH		10	—	
CS-SCL time	CSB	tCSS		20	—	
CS-SCL time		tCSH		140	—	

(V_{DD}=2.7V,Ta=30~85℃)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial Clock Period	SCL	tSCYC		100	—	ns
SCL “H” pulse width		tSHW		50	—	
SCL “L” pulse width		tSLW		50	—	
Address setup time	A0	tSAS		30	—	
Address hold time		tSAH		20	—	
Data setup time	SI	tSDS		30	—	
Data hold time		tSDH		20	—	
CS-SCL time	CSB	tCSS		30	—	
CS-SCL time		tCSH		160	—	

(V_{DD}=1.8V,Ta=30~85℃)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial Clock Period	SCL	tSCYC		200	—	ns
SCL “H” pulse width		tSHW		80	—	
SCL “L” pulse width		tSLW		80	—	
Address setup time	A0	tSAS		60	—	
Address hold time		tSAH		30	—	
Data setup time	SI	tSDS		60	—	
Data hold time		tSDH		30	—	
CS-SCL time	CSB	tCSS		40	—	
CS-SCL time		tCSH		200	—	

*1 The input signal rise and fall time (tr, tf) are specified at 15 ns or less.

*2 All timing is specified using 20% and 80% of VDD as the standard.

14. RESET TIMING

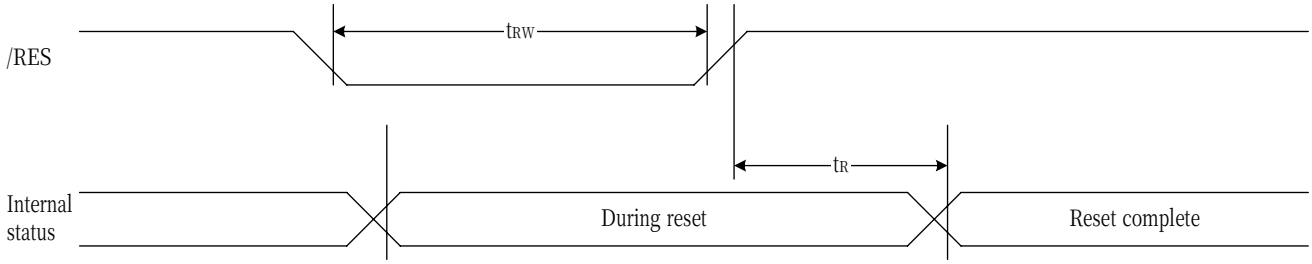

Fig 21.

(VDD = 3.3V , Ta = –30 to 85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	1	us
Reset “L” pulse width	RESB	tRW		1	—	—	us

(VDD = 2.7V , Ta = –30 to 85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	1.5	us
Reset “L” pulse width	RESB	tRW		1.5	—	—	us

(VDD = 1.8V , Ta = –30 to 85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	2.0	us
Reset “L” pulse width	RESB	tRW		2.0	—	—	us

15. APPLICATION INFORMATION

The pinning of the ST7556 is optimized for single plane wiring e.g. for chip-on-glass display modules. Display size: 64x102 pixels.

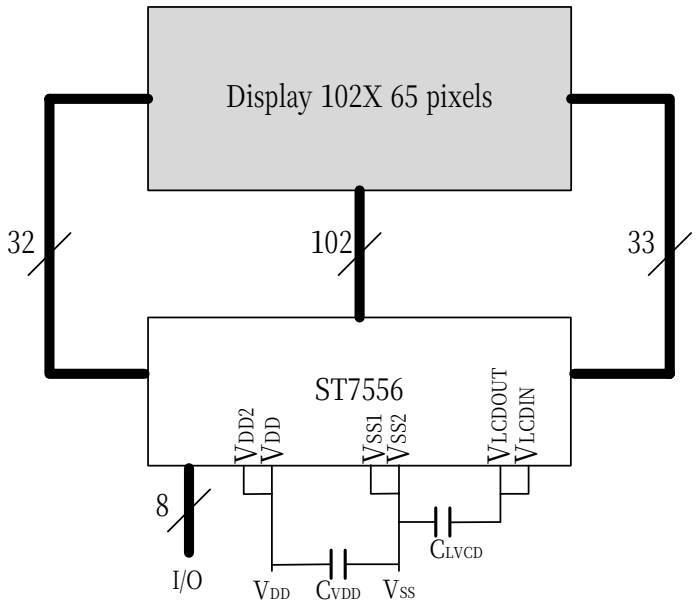

Fig 22. Application diagram: internal charge pump is used and single V_{DD}

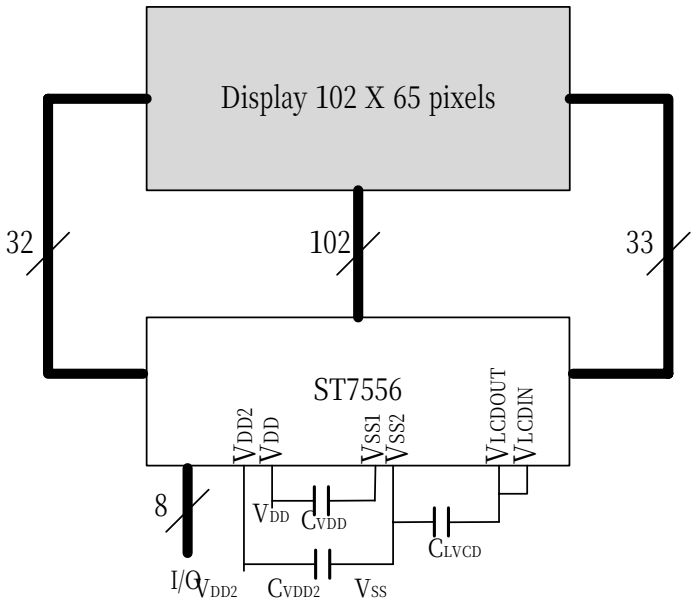

Fig 23. Application diagram: Internal charge pump is used and two separate VDD(V_{DD2})

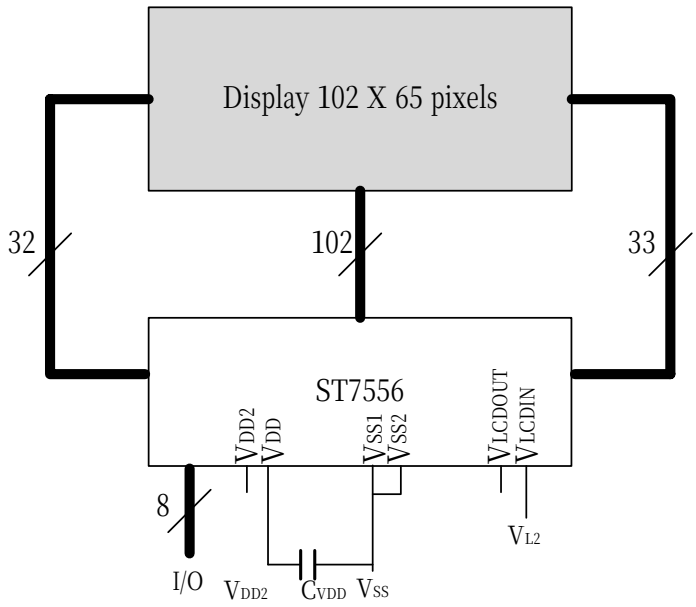

Fig 24. application diagram : External high voltage generation is used

The required minimum value for the external capacitors in an application with the ST7556 are:

C_{VLCD} = min. 100nF $C_{VDD,2}$= min. 1.0 µF

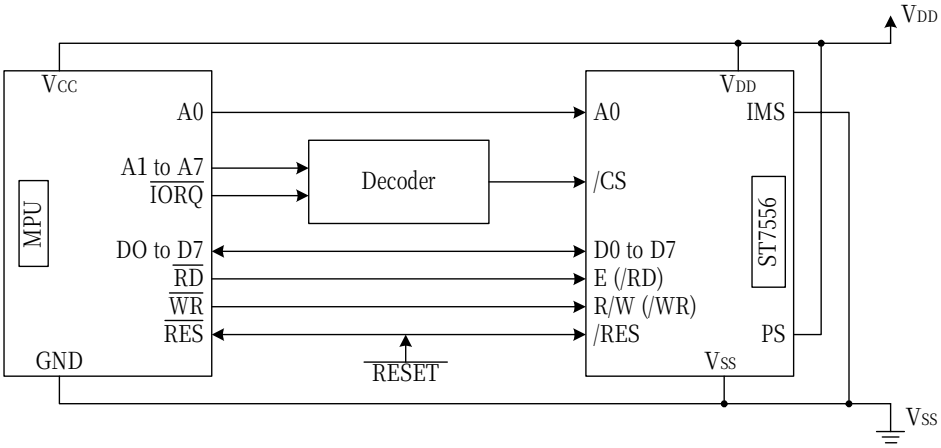
Higher capacitor values are recommended for ripple reduction.

16. THE MPU INTERFACE (REFERENCE EXAMPLES)

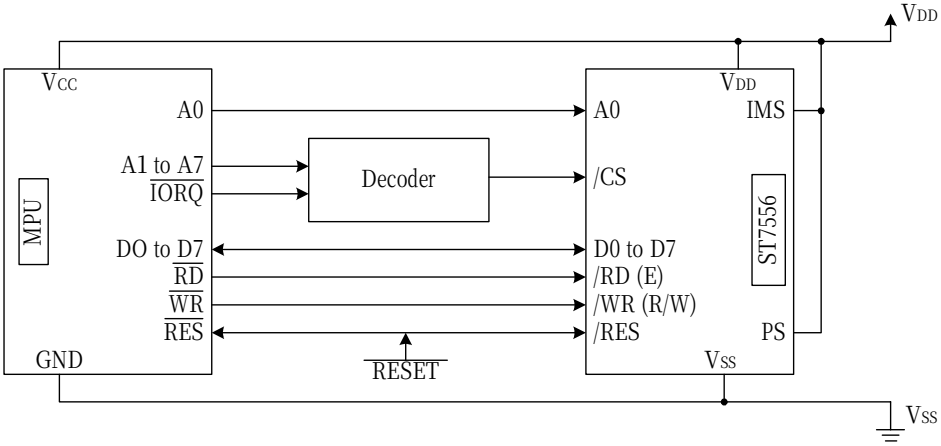
The ST7556 Series can be connected to either 80X86 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the ST7556 series chips with fewer signal lines.

The display area can be enlarged by using multiple ST7556 Series chips. When this is done, the chip select signal can be used to select the individual ICs to access.

(1) 8080 Series MPUs



(2) 6800 Series MPUs



(3) Using the Serial Interface (4-line interface)
