REVISION HISTORY

HARDWARE	
2009/04/01	Current hardware version: vA New module.

DATA SHEET	
2009/08/19	<p>Current Data Sheet version: v1.0 Since last revision (Preliminary), moved specifications into new Graphic TFT template.</p> <ul style="list-style-type: none">● Added Module Classification Information (Pg. 5).● Replaced "Mechanical Information" table with a new Physical Characteristics (Pg. 6) that includes more information.● Redrew Module Outline Drawings (Pg. 7) without touch screen. No touch screen on this module.● To Module Outline Drawings (Pg. 7), added Viewing Area specifications.● Redrew System Block Diagram / Circuit Example (Pg. 9) without touch screen and used CrystalFontz standard terms. No touch screen on this module.● Wherever listed, height dimension of module with folded FPC changed from "51.4" to "52.20" mm to include space for FPC bend.● Wherever listed, changed maximum depth dimension of module from "2.45" to "3.4" mm to include tabs and tolerance.● In Absolute Maximum Ratings (Pg. 10), lowered "Logic Supply Voltage" maximum from "+4.6v" to "+3.5v" and added "Power Supply Current for LCD".● Expanded information in DC Characteristics (3.0v Operation) (Pg. 10) and used standard CrystalFontz terms. Lowered "Logic Supply Voltage" maximum from "+3.5v" to "+3.3v".● In Details of Interface Pin Function (Pg. 11), changed pin symbols to CrystalFontz standard terms. Changed pins 28-31 from "touch panel coordinate" to "no connection". No touch screen on this module.● Added important information on ESD (Electro-Static Discharge) (Pg. 12).● Improved definitions of response time and viewing angles for Optical Characteristics (Pg. 13).● Deleted definition drawings that did not improve understanding module specifications.● Expanded LED Backlight Characteristics (Pg. 15) section to include how to calculate the power rating of the resistor.● Added information on MODULE RELIABILITY AND LONGEVITY (Pg. 18).
Continued on next page.	

DATA SHEET	
2009/08/19 Continued from previous page.	<ul style="list-style-type: none">● Replaced “Cautions and Handling Precautions” section with CARE AND HANDLING PRECAUTIONS (Pg. 19) including important information on Design and Mounting (Pg. 19), and Soldering (Pg. 20).● Added maximum storage life specification of “10 years” to Storage and Recycling (Pg. 21).● Replaced LCD Module Out-Going Quality Level section with APPENDIX A: QUALITY ASSURANCE STANDARDS (Pg. 22).● Added APPENDIX B: SAMPLE CODE (Pg. 25) and APPENDIX C: TFT MODULE TERMS AND SYMBOLS (Pg. 31).● Deleted information duplicated in the controller’s Data Sheet and added APPENDIX D: SITRONIX ST7773 CONTROLLER SPECIFICATION SHEET (Pg. 34).
2009/04/02	Data Sheet version: Preliminary New Data Sheet.

The Fine Print

Certain applications using CrystalFontz America, Inc. products may involve potential risks of death, personal injury, or severe property or environmental damage (“Critical Applications”). CRYSTALFONTZ AMERICA, INC. PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. Inclusion of CrystalFontz America, Inc. products in such applications is understood to be fully at the risk of the customer. In order to minimize risks associated with customer applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazard. Please contact us if you have any questions concerning potential risk applications.

CrystalFontz America, Inc. assumes no liability for applications assistance, customer product design, software performance, or infringements of patents or services described herein. Nor does CrystalFontz America, Inc. warrant or represent that any license, either express or implied, is granted under any patent right, copyright, or other intellectual property right of CrystalFontz America, Inc. covering or relating to any combination, machine, or process in which our products or services might be or are used.

The information in this publication is deemed accurate but is not guaranteed.

MAIN FEATURES

FEATURES

- ☐ Full-color (262K) 176xRGBx220 TFT consists of a TFT LCD panel, a driver IC, an FPC (Flexible Printed Circuit) tail, and an LED backlight.
- ☐ Module Dimensions
 - Active Area is 50.8 mm (2.00") diagonal, width and height 31.68 (W) x 39.60 (H) mm (1.25" (W) x 1.56" (H)).
 - Overall module dimension with FPC unfolded is 38.40 (W) x 68.80 (H) x 3.4 maximum (D) mm (1.51" (W) x 2.70" (H) 0.13" (D)).
 - Overall module dimension with FPC folded is 38.40 (W) x 52.20 (H) x 3.4 maximum (D) mm (1.51" (W) x 2.06" (H) x 0.13" (D)).
- ☐ Requires only a single source 3.0v for both power supply and logic.
- ☐ 8-bit parallel (8080) interface.
- ☐ Driver IC is [Sitronix ST7773](#) or compatible controller.
- ☐ Transmissive display with LED backlight (edge-lit three white LEDs). Display light pixels on a dark colored area (any color combination) or invert for dark colored pixels (any color combination) on a light area.
- ☐ 12:00 o'clock Viewing Angle.
- ☐ Wide temperature operation: -20°C to +70°C.
- ☐ RoHS compliant.

ABSOLUTE MAXIMUM RATINGS

Ambient Temperature (Ta) = 25°C, Maximum 75% Relative Humidity			
Absolute Maximum Ratings	Symbol	Minimum	Maximum
Operating Temperature*	T _{OP}	-20°C	+70°C
Storage Temperature*	T _{ST}	-30°C	+80°C
Logic Supply Voltage	V _{LOGIC}	-0.3v	+3.5v
Power Supply Current for LCD	I _{DD}	4mA	6mA
*Prolonged exposure at temperatures outside of this range may cause permanent damage to the module.			

DC CHARACTERISTICS (3.0V OPERATION)

DC CHARACTERISTICS	TEST CONDITION	SYMBOL	MINIMUM	TYPICAL	MAXIMUM
Logic Supply Voltage	T _{OP} = -20°C to +70°C	V _{LOGIC}	+2.7	+2.8v	+3.3v
Supply Voltage for I/O signals	T _{OP} = -20°C to +70°C	V _{LOGIC I/O}	+1.6v	+1.8v	
Input High Voltage		V _{IH}	+0.7v x V _{Logic} For V _{Logic} = +2.8v V _{OH} = +0.7v x +2.8v = +1.96v		V _{Logic}
Input Low Voltage		V _{IL}	0v (GND)		+0.3v x V _{Logic} For V _{Logic} = +2.8v V _{IL} = +0.3v x +2.8v = +0.84v
Output High Voltage	I _{OUT} = 100μA 3.3MHz	V _{OH}	+0.8v x V _{Logic} For V _{Logic} = +2.8v V _{OH} = +0.8v x +2.8v = +2.24v		V _{Logic}
Output Low Voltage	I _{OUT} = 100μA 3.3MHz	V _{OL}	0v (GND)		+0.2v x V _{Logic} For V _{Logic} = +2.8v V _{OL} = +0.2v x +2.8v = +0.56v
Current for Normal Operation		I _{OP}		2.51 mA	5.05 mA
Current for Standby Mode		I _{ST}		10μA	20μA

This is a summary of the module's major operating parameters. For detailed information see [APPENDIX D: SITRONIX ST7773 CONTROLLER SPECIFICATION SHEET \(Pg. 34\)](#).

DETAILS OF INTERFACE PIN FUNCTION

PIN	SIGNAL	LEVEL	DIRECTION	DESCRIPTION
1	GND	0v		Ground. Must be connected to an external ground.
2	NC			No Connection
3	$\overline{\text{RST}}$	L	I	Reset signal. <i>Low:</i> Display controller is reset. The $\overline{\text{RST}}$ pin should be pulsed low shortly after power is applied. <i>High:</i> The RST pin should be brought high for normal operation.
4-11	NC			No Connection
12-19	DB0-DB07	H/L	I/O	Databus connects to 8-bit standard host databus.
20	$\overline{\text{RD}}_{8080}$	H/L	I/O	Host interface input. <i>8080 Host:</i> Active low. Signal on the databus is latched at the rising edge of RD.
21	$\overline{\text{WR}}_{8080}$	H/L	I	Write enable clock input pin. The data on DB0 to D07 are latched at the rising edge of the $\overline{\text{WR}}$ signal
22	D/ $\overline{\text{C}}$	H/L	I	Data/Command control. Determines whether data bits are data or command. <i>1 – High:</i> Addresses the data register. <i>0 – Low:</i> Addresses the command register.
23	$\overline{\text{CS}}$	H/L	I	Chip select input. <i>Low:</i> Controller chip is selected. Communications with host is possible. <i>High:</i> Controller chip is not selected. Host interface signals are ignored by the controller.
24	V _{LOGIC}	+2.7 to +3.3v	I	Power supply input. Must be connected to an external source.
25	GND	0v		Ground. Must be connected to an external ground.
26	V _{LOGIC I/O}		I/O	Supply voltage for I/O signals.
27-31	NC			No Connection.
32	GND	0v		Ground. Must be connected to an external ground.
33	A1 (LED +)			Supply pin for LED. “A” (anode) or “+” of LED backlight.
34	A2 (LED +)			Supply pin for LED. “A” (anode) or “+” of LED backlight.
Continued on next page.				

PIN	SIGNAL	LEVEL	DIRECTION	DESCRIPTION
35	A3 (LED +)			Supply pin for LED. "A" (anode) or "+" of LED backlight.
36	NC			No Connection.
37	K (LED -)			Supply pin for LED. "K" (cathode or kathode for German and original Greek spelling) or "-" of LED backlight.
<i>For backlight connections, please refer to LED Backlight Characteristics (Pg. 15).</i>				

ESD (ELECTRO-STATIC DISCHARGE)

The circuitry is industry standard CMOS logic and susceptible to ESD damage. Please use industry standard antistatic precautions as you would for any other PCB such as expansion cards or motherboards. Ground your body, work surfaces, and equipment.

OPTICAL SPECIFICATIONS

OPTICAL CHARACTERISTICS

Ambient Temperature (Ta) = 25°C, Maximum 75% Relative Humidity					
ITEM	SYMBOL	ADDITIONAL TEST CONDITIONS	MINIMUM	TYPICAL	MAXIMUM
Color Depth				262K	
Transmittance	T			6.6%	
Contrast Ratio (CR) ¹		$\theta = \psi - 0^\circ$		300	
LCD Response Time ²	Tr			12 ms	20 ms
	Tf			18 ms	30 ms
Red Chromaticity	x		.635	.655	.675
	y		.309	.329	.349
Green Chromaticity	x		.292	.312	.332
	y		.555	.575	.595
Blue Chromaticity	x		.114	.134	.154
	y		.115	.135	.156
White Chromaticity	x		.290	.310	.330
	y		.321	.341	.361
Viewing Angle, Horizontal	θ_{X+}	Center CR ≥ 10		40	
	θ_{X-}			20	
Viewing Angle, Vertical	θ_{Y+}			45	
	θ_{Y-}			45	
Viewing Direction				>12:00	
¹ Contrast Ratio = (brightness with pixels light)/(brightness with pixels dark). ² Response Time: The amount of time it takes a pixel to change from active to inactive or back again. Tr = T rise, Tf = T fall.					

Definition of Response Time (T_r , T_f)

Figure 3. Definition of Response Time (T_r , T_f)

Definition of Vertical and Horizontal Viewing Angles ($CR_{\geq 2}$)

Figure 4. Definition of Horizontal and Vertical Viewing Angles ($CR_{\geq 2}$)

Definition of 6 O'Clock and 12:00 O'Clock Viewing Angles

This module has a 12:00 o'clock viewing angle. A 6:00 o'clock viewing angle is a bottom viewing angle like what you would see when you look at a cell phone or calculator. A 12:00 o'clock viewing angle is a top viewing angle like what you would see when you look at the gauges in a golf cart or airplane.

Figure 5. Definition of 6:00 O'Clock and 12:00 O'clock Viewing Angles

LED BACKLIGHT CHARACTERISTICS

The CFAF176220M-T uses an LED backlight. LED backlights are easy to use, but they are also easily damaged by abuse.

NOTE

Do not connect +5v directly to the backlight terminals. This will ruin the backlight.

NOTE

We recommend that the LED backlight be dimmed or turned off during periods of inactivity to conserve its lifetime.

LEDs are "current" devices. The important aspect of driving an LED is the current flowing through it, not the voltage across it. Ideally, a current source would be used to drive the LEDs. In practice, a simple current limiting resistor in line from a voltage source will work well in most applications and is much less complex than a current source.

You need to know what the forward voltage of the LEDs is so you can calculate the current limiting resistor (R_{LIMIT}). The forward voltage will vary slightly from display to display.

Figure 6. Typical LED Backlight Connections for "Always On"

The equation to calculate R_{LIMIT} is:

$$R_{LIMIT1} = R_{LIMIT2} = R_{LIMIT3} \text{ (minimum)} = \frac{V_{LOGIC} \text{ (Supply Voltage)} - V_{LED} \text{ (Typical LED Forward Voltage)}}{I_{LED} \text{ (Typical LED Forward Current, Single LED)}}$$

The specific R_{LIMIT} calculation for the CFAF176220M-T at $V_{LOGIC} = +3.3v$ is:

$$R_{LIMIT} = \frac{3.3v - 3.2v}{0.015A} = 6.66 \Omega \text{ (minimum — use next larger standard size)}$$

How to Calculate the Power Rating of the Resistor

The general equation to calculate the power rating of the resistor is:

$$P = IE$$

Where

P = Power. Measured in Watts (W).

I = Current. Measured in amperes (A). "I" is from the outdated term "Intensity".

E = Voltage. Measured in volts (v). "E" is from the outdated term "Electromotive force".

The specific power rating calculation for CFAF176220M-T is:

$$P = 0.015A \times (3.3v - 3.2v) = 0.0015W = 1.5mW$$

Please select a resistor that can safely dissipate 1.5 mW while keeping its temperature at an acceptably low value for your application.

PWM Dimming

The backlight may be dimmed by PWM (Pulse Width Modulation). The typical range for the PWM frequency is from 100 to 300 Hz.

Figure 7. Example of LED Backlight Connections for PWM Dimming

Ambient temperature: $T_A = 25^{\circ}\text{C}$			
Backlight Characteristics*			
<i>Edge-lit with three LEDs.</i>			
<i>White LED backlight displays light pixels on a dark colored area (any color combination) or invert for dark colored pixels (any color combination) on a light area.</i>			
PARAMETER	MINIMUM	TYPICAL	MAXIMUM
Forward Current (I_{LED})		15mA per LED 20mA x 3 = 45mA	20mA per LED 20mA x 2 = 60mA
Forward Voltage (V_{LED})	+3.0v	+3.2v	+3.4v
Luminous Intensity* (I_V) $I_{LED} = 45\text{ mA}$	165 cd/m ²	200 cd/m ²	
Reverse Voltage (V_R)			+4.5v
Uniformity (minimum/maximum x 100%)	80%		
<i>*Direct measurement of backlight—the backlight is not measured through the LCD.</i>			

TFT CONTROLLER INTERFACE

This module uses a Sitronix ST7773 controller. For your reference, we added [APPENDIX D: SITRONIX ST7773 CONTROLLER SPECIFICATION SHEET \(Pg. 34\)](#) to this Data Sheet.

MODULE RELIABILITY AND LONGEVITY

MODULE RELIABILITY

ITEM	SPECIFICATION*
CFAF176220M-T	50,000 hours >50% of Initial Brightness (New Module)
<i>*Under operating and storage temperature specification limitations, room temperature at 10°C, humidity RH 45+20%, and no exposure to direct sunlight.</i>	

The white LEDs dim over time, especially if driven with high currents. The dimming may not be noticeable when a single display is installed. However, if a new display is installed next to a display that has been on continuously for a very long time, you will see the difference. To preserve the lifetime of white LEDs, we recommend that white LED backlights are dimmed or turned off when not needed. *Also, please do not use more current than you need to achieve your brightness requirements.*

MODULE LONGEVITY (EOL/REPLACEMENT POLICY)

CrystalFontz is committed to making all of our modules available for as long as possible. For each module we introduce, we intend to offer it indefinitely. We do not preplan a module's obsolescence. The majority of modules we have introduced are still available.

We recognize that discontinuing a module may cause problems for some customers. However, rapidly changing technologies, component availability, or low customer order levels may force us to discontinue ("End of Life", EOL) a module. For example, we must occasionally discontinue a module when a supplier discontinues a component or a manufacturing process becomes obsolete. When we discontinue a module, we will do our best to find an acceptable replacement module with the same fit, form, and function.

In most situations, you will not notice a difference when comparing a "fit, form, and function" replacement module to the discontinued module. However, sometimes a change in component or process for the replacement module results in a slight variation, perhaps an improvement, over the previous design.

Although the replacement module is still within the stated Data Sheet specifications and tolerances of the discontinued module, changes may require modification to your circuit and/or firmware. Possible changes include:

- **Controller.** A new controller may require minor changes in your code.
- **Component tolerances.** Module components have manufacturing tolerances. In extreme cases, the tolerance stack can change the visual or operating characteristics.

Please understand that we avoid changing a module whenever possible; we only discontinue a module if we have no other option. We will post Part Change Notices on the product's webpage as soon as possible. If interested, you can subscribe to future part change notifications.

CARE AND HANDLING PRECAUTIONS

For optimum operation of the module and to prolong its life, please follow the precautions below.

ESD (ELECTRO-STATIC DISCHARGE)

The circuitry is industry standard CMOS logic and susceptible to ESD damage. Please use industry standard antistatic precautions as you would for any other PCB such as expansion cards or motherboards. Ground your body, work surfaces, and equipment.

DESIGN AND MOUNTING

- The exposed surface of the “glass” is actually a polarizer laminated on top of the glass. To protect the soft plastic polarizer from damage, the module ships with a protective film over the polarizer. Please peel off the protective film slowly. Peeling off the protective film abruptly may generate static electricity.
- The polarizer is made out of soft plastic and is easily scratched or damaged. When handling the module, avoid touching the polarizer. Finger oils are difficult to remove.
- To protect the soft plastic polarizer from damage, place a transparent plate (for example, acrylic, polycarbonate, or glass) in front of the module, leaving a small gap between the plate and the display surface. We use GE HP-92 Lexan, which is readily available and works well.
- Do not disassemble or modify the module.
- Do not modify the tab of the metal holder or make connections to it.
- Do not reverse polarity to the power supply connections. Reversing polarity will immediately ruin the module.
- Use care to keep the exposed terminals clean. Contamination, including fingerprints may make soldering difficult, and the reliability of the soldered connection poor.

TAB SOLDERING

This module uses a "TAB" (tape automated bonding) or "COF" (chip on flex) style flex tail mated with a "COG" (chip on glass) display controller. The TAB is soldered directly to corresponding pads on your PCB by using a hot-bar soldering machine. High volume contract manufacturers will be familiar with this type of construction and its assembly methods.

Hot-bar soldering machines designed for prototype, rework, or repair of TAB connections are available from equipment suppliers at reasonable cost. The TAB style connection requires no separate connector so the cost is very low and the ultrathin profile of the display is maintained.

Figure 8. Typical Tab Solder Tail Construction

Hot Bar Soldering Machine

We have had good experience with the [APE](#) Bondmaster and their price is reasonable (\$US4K in June 2009). Other possible solutions are:

<http://www.fancort.com/hotbar/hotbar.html>

<https://www.manncorp.com/hot-bar-soldering/pbs-series/index.php?auto=done>

<http://www.cherusal.com/tm-111mkiii.htm>

The process is:

1. Pads on the PCB are tinned.
2. Tail is visually aligned to the PCB or by using the alignment holes.
3. Tail is held in place relative to the PCB with Kapton® tape.
4. Bondmaster head is lowered, applying pressure between the tail and the PCB.
5. Bondmaster is "cycled", which means it heats up to the point of melting the solder and then cools down.
6. Bondmaster head is raised.

Hand Soldering

For prototype work, hand soldering may be acceptable. Preset soldering iron to <260°C. Do not apply heat for more than 3 to 4 seconds. The FPC is quite fragile; use extreme care when soldering by hand. Great care must be taken since the conductors of the tail are completely exposed in the area where they are soldered. Solder only to the exposed terminals of the FPC connector. The use of Kapton® tape to help locate and secure the FPC may be useful.

AVOID SHOCK, IMPACT, TORQUE, OR TENSION

- Do not expose the module to strong mechanical shock, impact, torque, or tension.
- Do not drop, toss, bend, or twist the module.
- Do not place weight or pressure on the module.

CLEANING

The polarizer (laminated to the glass) is soft plastic. The soft plastic is easily scratched or damaged. Be very careful when you clean the polarizer.

- Do not clean the polarizer with liquids. Do not wipe the polarizer with any type of cloth or swab (for example, Q-tips).
- Use the removable protective film to remove smudges (for example, fingerprints) and any foreign matter. If you no longer have the protective film, use standard transparent office tape (for example, Scotch® brand "Crystal Clear Tape"). If the polarizer is dusty, you may carefully blow it off with clean, dry, oil-free compressed air.

OPERATION

- We do not recommend connecting this module to a PC's parallel port as an "end product." This module is not "user friendly" and connecting it to a PC's parallel port is often difficult, frustrating, and can result in a "dead" display due to mishandling. For more information, see our forum thread at <http://www.crystalfontz.com/forum/showthread.php?s=&threadid=3257>.
- Your circuit should be designed to protect the module from ESD and power supply transients.
- Observe the operating temperature limitations: from -20°C minimum to +70°C maximum with minimal fluctuations. Operation outside of these limits may shorten the life and/or harm the display.
- Operate away from dust, moisture, and direct sunlight.

STORAGE AND RECYCLING

- Store in an ESD-approved container away from dust, moisture, and direct sunlight, fluorescent lamps, or any ultraviolet ray.
- Observe the storage temperature limitations: from -30°C minimum to +80°C maximum with minimal fluctuations. Rapid temperature changes can cause moisture to form, resulting in permanent damage.
- Maximum storage life is 10 years within storage temperature limitations and normal humidity.
- Do not allow weight to be placed on the modules while they are in storage.
- Please recycle your outdated CrystalFontz modules at an approved facility.

APPENDIX A: QUALITY ASSURANCE STANDARDS

INSPECTION CONDITIONS

- Environment
 - Temperature: $25 \pm 5^{\circ}\text{C}$
 - Humidity: 30~85% RH (noncondensing)
- For visual inspection of active display area
 - Source lighting: two 20-Watt or one 40-Watt fluorescent light
 - Display adjusted for best contrast
 - Viewing distance: 30 ± 5 cm (about 12 inches)
 - Viewing angle: inspect at 45° angle of vertical line right and left, top and bottom

COLOR DEFINITIONS

We try to describe the appearance of our modules as accurately as possible. For the photos, we adjust for optimal appearance. Actual display appearance may vary due to (1) different operating conditions, (2) small variations of component tolerances, (3) inaccuracies of our camera, (4) color interpretation of the photos on your monitor, and/or (5) personal differences in the perception of color.

DEFINITION OF VIEWING AREA AND ACTIVE AREA

ACCEPTANCE SAMPLING

DEFECT TYPE	AQL*
Major	$\leq .65\%$
Minor	$<1.0\%$
* Acceptable Quality Level: maximum allowable error rate or variation from standard	

DEFECTS CLASSIFICATION

Defects are defined as:

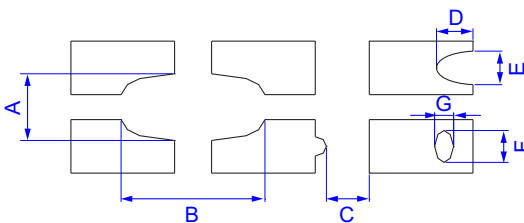

- Major Defect: results in failure or substantially reduces usability of unit for its intended purpose.
- Minor Defect: deviates from standards but is not likely to reduce usability for its intended purpose.

ACCEPTANCE STANDARDS

#	DEFECT TYPE	CRITERIA			MAJOR / MINOR
1	Electrical defects	1. No display, display malfunctions, or shorted segments. 2. Current consumption exceeds specifications.			Major
2	Viewing area defect	Viewing area does not meet specifications.			Major
3	Blemishes or foreign matter on display segments		Defect Size	Acceptable Qty	Minor
			≤0.30 mm	3	
			≤2 defects within 10 mm of each other		
4	Dark lines or scratches in display area	Defect Width	Defect Length	Acceptable Qty	Minor
		≤0.03 mm	≤3.0 mm	3	
		0.03 to 0.05	≤2.0 mm	2	
		0.05 to 0.08	≤2.0 mm	1	
		0.08 to 0.10	≤3.0 mm	0	
		≥0.10	>3.0 mm	0	

ACCEPTANCE STANDARDS, CONTINUED

#	DEFECT TYPE	CRITERIA		MAJOR / MINOR
5	Bubbles between polarizer film and glass	Defect Size	Acceptable Qty	Minor
		≤0.20 mm	Ignore	
		0.20 to 0.40 mm	3	
		0.40 to 0.60 mm	2	
		≥0.60 mm	0	
6	Display pattern defect			Minor
		Pixel Size	Acceptable Qty	
		$((A+B)/2) \leq 0.20 \text{ mm}$	$\leq 3 \text{ total defects}$ $\leq 2 \text{ pinholes per digit}$	
		$C > 0 \text{ mm}$		
		$((D+E)/2) \leq 0.25 \text{ mm}$		
		$((F+G)/2) \leq 0.25 \text{ mm}$		
7	PCB defects	1. Oxidation or contamination on connectors.* 2. Wrong parts, missing parts, or parts not in specification.* 3. Jumpers set incorrectly. 4. Solder (if any) on bezel, LED pad, zebra pad, or screw hole pad is not smooth. *Minor if display functions correctly. Major if the display fails.		Minor
8	Soldering defects	1. Unmelted solder paste. 2. Cold solder joints, missing solder connections, or oxidation.* 3. Solder bridges causing short circuits.* 4. Residue or solder balls. 5. Solder flux is black or brown. *Minor if display functions correctly. Major if the display fails.		Minor

APPENDIX B: SAMPLE CODE

SOURCES FOR DRIVER LIBRARIES

Graphic LCD driver libraries may save you a lot of time and help you develop a more professional product. Possible library sources are [easyGUI](#), [RAMTEX](#), [Micrium](#), [en.radzio.dxp.pl](#), and [Segger](#).

SAMPLE CODE

This code reads images off the MicroSD card which are written in the bin format used by Image2LCD. You can download the complete source from this link: <https://www.crystalfontz.com/product/CFAF176220MT.html#docs>.

```

APPENDIX C: TFT MODULE TERMS AND SYMBOLS

CrystalFontz Symbol	Equivalent	Equivalent	Equivalent	Description
A (LED +)				Supply pin for LED. "A" (anode) or "+" of LED backlight. If more than one, may be labeled as A ₁ , A ₂ , ...
cd/m ²	lumen			Candela per square meter. A unit of measurement used to measure Luminous Intensity. cd/m ² = 1 lumen.
$\overline{\text{CS}}$	CS#			Chip select input. <i>Low</i> : Controller chip is selected. Communications with host is possible. <i>High</i> : Controller chip is not selected. Host interface signals are ignored by the controller.
COF				Chip On Flex. Controller is on the FPC. Similar in appearance to "TAB". The flex circuit on COF is typically much thinner than the flex of a "flex tail".
COG				Chip On Glass. Controller is on the glass panel.
DB0 ~ DBn	D0 ~ Dn			Parallel databus.
D/ $\overline{\text{C}}$	RS	A0	CD or D/C#	Data/Command control. Determines whether data bits are data or command. <i>1 – High</i> : Addresses the data register. <i>0 – Low</i> : Addresses the command register.
ESD				Electro-Static Discharge. Sudden and brief electrical current that flows between two objects. ESD between a human and a TFT module can cause permanent damage.
FPC				Flexible Printed Circuit. Also called "flex tail". Typically much thicker than the "flex" film of COF (Chip On Flex).
GND	V _{SS}			Ground. Must be connected to an external ground.
I _{DD}				Typical power supply current for LCD. Total electrical current (I) in the Drains of a CMOS circuit
I _{LED}				Current used by LED backlight.
I _{OP}				Current for normal OPeration, typically measured in milliamperes (mA). 1 mA = 0.001A (Ampere)

CrystalFontz Symbol	Equivalent	Equivalent	Equivalent	Description
I_{ST}				Current for STandby mode, typically measured in microampere (μA). 1 μA = 0.000,001A (Ampere)
I/O	IO			Input/Output
K (LED -)				Supply pin for LED. "K" (cathode or kathode for German and original Greek spelling) or "-" of LED backlight. If more than one, may be labeled as K_1 , K_2 , ...
mm				Millimeter or millimetre. Unit of length equal to one thousandth of a meter. 1 millimeter = 0.0394 inches.
mW				Milliwatt is equal to one thousandth of a Watt. Watts = Volts x Amps.
NC	nc			No Connection.
PWM				Pulse Width Modulation is a way to simulate intermediate levels by switching a level between full on and full off. PWM is typically used to control the brightness of LED backlights, relying on the natural averaging by the human eye.
\overline{RD}_{8080}	\overline{RD} (E)	E (\overline{RD})	E	Host interface input. 8080 Host: Active low. Signal on the databus is latched at the rising edge of \overline{RD} .
RGB				Typically used to indicate that Red, Green, and Blue are combined to produce a broad array of colors.
RoHS				Restriction of Hazardous Substances Directive, an environmental standard.
\overline{RST}	\overline{RES}	RST#	RES#	Reset signal. Low: Display controller is reset. The \overline{RST} pin should be pulsed low shortly after power is applied. High: The \overline{RST} pin should be brought high for normal operation.
Ta	TA			"Ambient temperature" is the temperature of the air that surrounds a component.
Tf				Unit of measurement for LCD response time. f = falling edge. See Definition of Response Time (Tr, Tf) (Pg. 14) .
TFT				Thin-Film Transistor fabricated directly on the display substrate.

Crystalfontz Symbol	Equivalent	Equivalent	Equivalent	Description
T_{OP}				OPerating Temperature.
T_r				Unit of measurement for LCD response time. r = rising edge. See Definition of Response Time (Tr, Tf) (Pg. 14) .
T_{ST}	T_{STG}			STorage Temperature.
V_{IH}	V_{ICH}			High level input voltage.
V_{IL}	V_{LCH}			Low level input voltage.
V_{LED}				Forward voltage for LED backlight.
V_{LOGIC}	V_{CC}	V_{DD}		Power supply input. Must be connected to an external source.
$V_{LOGIC\ I/O}$	V_{CCIO}			Supply voltage for I/O signals.
V_{OH}	V_{OHC}			High level output voltage.
V_{OL}	V_{OLC}			Low level output voltage.
\overline{WR}_{8080}	R/\overline{W} (\overline{WR})	\overline{WR} (R/\overline{W})	$R/W\#$	Host interface input. <i>8080 Host:</i> Active low. Signal on the databus is latched at the rising edge of \overline{WR} signal.

APPENDIX D: SITRONIX ST7773 CONTROLLER SPECIFICATION SHEET

The complete SITRONIX ST7773 Data Sheet (128 pages) follows.

Sitronix

ST7773

262K Color Single-Chip TFT Controller/Driver

1. Introduction

ST7773 is a single-chip controller/driver for 262K-color, graphic type TFT-LCD. It consists of 528 source line and 220 gate line driver circuits. This chip can be connected to a microprocessor direct through Serial Peripheral Interface (SPI) or 8-bits/9-bits/16-bits/18-bits parallel interface. The display data is stored in the on-chip Display Data RAM (DDRAM) of 176x220x18 bits. It can perform display data RAM read/write operation with no external operation clock to minimize power consumption. In addition, because of the integrated power supply circuits necessary to drive liquid crystal, it is possible to make a display system with fewer components.

2. Features

Single chip TFT-LCD Controller/Driver with RAM

On-chip Display Data RAM (i.e. Frame Memory)

- 176 x 220 x 18 = 696,960 bits

LCD Driver Output Circuits:

- Source Outputs: 176 RGB channels
- Gate Outputs: 220 channels

Display Resolution

- 176 (RGB) x 220

Display Colors (Color Mode)

- Full Color: 262K, RGB=(666) max., Idle Mode OFF
- Color Reduce: 8-color, RGB=(111), Idle Mode ON

Programmable Pixel Color Format (Color Depth) for Various Display Data input Format

- 12-bit/pixel: RGB=(444) using whole frame memory
- 16-bit/pixel: RGB=(565) using whole frame memory
- 18-bit/pixel: RGB=(666) using whole frame memory

Various Interfaces

- Parallel 8080-series MCU Interface
(8-bit, 9-bit, 16-bit & 18-bit)
- 3-line serial interface

Display Features

- Programmable partial display duty
- Line inversion, frame inversion
- Supporting MVA type LC
- Support both normal-black & normal-white LC

Built-in Circuits

- DC/DC converter
- Adjustable VCOM
- 4 preset gamma curves (1.0, 1.8, 2.2 & 2.5)
- Oscillator for display clock generation
- Timing controller

Built-in NV Memory for LCD Initial Register Setting

- 7-bits for ID2
- 7-bits for VCOM adjustment

Wide Supply Voltage Range

- I/O Voltage (VDDI to DGND): 1.6V~3.3V
- Analog Voltage (VDD to AGND): 2.7V~3.3V

On-Chip Power System

- Source Voltage (GVDD to AGND): 3.0V~5.0V
- VCOM HIGH level (VCOMH to AGND): 2.5V to 5.0V
- VCOM LOW level (VCOML to AGND): -2.5V to 0.0V
- Gate driver HIGH level (VGH to AGND):
+10.0V to 16V
- Gate driver LOW level (VGL to AGND):
-13V to -5.5V

Operating Temperature: -30°C to +85°C

ST7773

**8080 MCU Interface: 8-bit/9-bit/16-bit/18-bit
Serial Peripheral Interface : 3-line**

6.4 Driver output pin

Name	I/O	Description	Count	Connect pin
S1 to S528	O	- Source driver output pins.	528	-
G1 to G220	O	- Gate driver output pins.	220	-
VCI1	I/O	- A reference voltage for step-up circuit 1. - Connect a capacitor for stabilization.	4	Capacitor
AVDD	I	- Power input pin for analog circuits. - In normal usage, connect it to AVDDO.	4	AVDDO
AVDDO	O	- Output of step-up circuit 1 - Connect a capacitor for stabilization.	4	Capacitor
VCL	I	- Power input pin for VCOM circuit. - In normal usage, connect it to VCLO.	3	VCLO
VCLO	O	- A power output pin of step-up circuit 4. - When VCOML is higher than AGND, VCLO=AGND. - Connect a capacitor for stabilization.	1	Capacitor
VGH	I	- Power input pin for gate driver circuit. - In normal usage, connect it to VGHO.	2	VGHO
VGHO	O	- Positive output pin of the step-up circuit 2. - Connect a capacitor for stabilization.	1	Capacitor
VGL	I	- Power input pin for gate driver circuit. - Negative output of the step-up circuit 2 is connected inside the driver. - Connect a capacitor for stabilization.	3	VGLO
VREF	O	- A reference voltage for power system. - Connect a capacitor for stabilization.	1	Capacitor
GVDD	O	- A power output of grayscale voltage generator. - Connect a capacitor for stabilization. - When internal GVDD generator is not used, connect an external power supply (AVDD-0.5V) to this pin.	2	Capacitor
VCOMH	O	- Positive voltage output of VCOM. - Connect a capacitor for stabilization.	4	Capacitor
VCOML	O	- Negative voltage output of VCOM. - Connect a capacitor for stabilization.	4	Capacitor
VCOM	O	- A power supply for the TFT-LCD common electrode.	6	Common electrode
C11P, C11N, C12P, C12N	O	- Capacitor connecting pins for step-up circuit 1 (for AVDDO)	16	Step-up Capacitor
C21P, C21N, C22P, C22N, C23P, C23N	O	- Capacitor connecting pins for step-up circuit 2 and 4 (for VGHO, VGLO, VCLO)	18	Step-up Capacitor
VDDIO	O	-VDDI voltage output level for monitoring.	6	-
DGND0	O	-DGND voltage output level for monitoring.	9	-
VCCO	O	-Monitoring pin of internal digital reference voltage. -Connect a capacitor for stabilization.	5	Capacitor

6.5 Test pin

Name	I/O	Description	Count	Connect pin
TEST	I	-Please connect this pin to DGND	19	DGND
TPI[3]~[0]	I	-Please open these pins.	4	Open
TPO[7]~[0]	O	-Please open these pins.	8	Open
Dummy	-	-These pins are dummy (have no function inside). -Can allow signal traces pass through these pads on TFT glass.	4	Open

ST7773

7. Driver electrical characteristics

7.1 Absolute operation range

Item	Symbol	Rating	Unit
Supply voltage	VDD	- 0.3 ~ +4.6	V
Supply voltage (Logic)	VDDI	- 0.3 ~ +4.6	V
Supply voltage (Digital)	VCC	-0.3 ~ +4.6	V
Driver supply voltage	VGH-VGL	-0.3 ~ +30.0	V
Logic input voltage range	V _{IN}	0.3 ~ VDDI + 0.3	V
Logic output voltage range	V _O	0.3 ~ VDDI + 0.3	V
Operating temperature range	T _{OPR}	-30 ~ +85	°C
Storage temperature range	T _{STG}	-40 ~ +125	°C

Note: If one of the above items is exceeded its maximum limitation momentarily, the quality of the product may be degraded. Absolute maximum limitation, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the recommend range.

7.2 DC characteristic

Parameter	Symbol	Condition	Specification			Unit	Related Pins
			Min	TYP	Max		
Power & operation voltage							
System voltage	VDD	Operating voltage	2.7	2.8	3.3	V	
Interface operation voltage	VDDI	I/O supply voltage	1.6	1.8	3.3	V	
Gate driver high voltage	VGH		10		16	V	
Gate driver low voltage	VGL		-13		-5.5	V	
Gate driver supply voltage		VGH-VGL	15.5		29.0	V	
Input / Output							
Logic-high input voltage	V _{IH}		0.7VDDI		VDDI	V	Note 1
Logic-low input voltage	V _{IL}		VSS		0.3VDDI	V	Note 1
Logic-high output voltage	V _{OH}	I _{OH} = -1.0mA	0.8VDDI		VDDI	V	Note 1
Logic-low output voltage	V _{OL}	I _{OL} = +1.0mA	VSS		0.2VDDI	V	Note 1
Input leakage current	I _{IL}	IOH = -1.0mA	-1		+1	uA	Note 1
VCOM voltage							
VCOM high voltage	VCOMH	Ccom=22nF	2.5		5.0	V	
VCOM low voltage	VCOML	Ccom=22nF	-2.5		0.0	V	
VCOM amplitude	VCOMAC	VCOMH-VCOML	4.0		6.0	V	
Source driver							
Gamma reference voltage	GVDD		3.0		5.0	V	
Source output settling time	Tr	Below with 99% precision		25	30	us	Note 2
Output offset voltage	V _{OFSET}				35	mV	Note 3

Note 1: VDDI=1.6 to 3.3V, VDD=2.7 to 3.3V, AGND=DGND=0V, T_A=-25 °C

Note 2, Source channel loading= 10pF/channel, Gate channel loading=50pF/channel.

Note 3, The Max. value is between measured point of gamma setting value.

7.3 Power consumption

T_a=25°C, Frame rate = 60Hz, the registers setting are IC default setting.

Operation mode	Inversion mode	Image	Current consumption	
			Typical	Maximum
			IDD+IDDI (mA)	IDD+IDDI (mA)
-Normal mode	One Line	Note 1	2.2	3.0
	One Line	Note 2	2.2	3.0
-Partial + Idle mode (40 lines)	One Line	Note 1	1.3	1.6
		Note 2	1.3	1.6
-Sleep-in mode	N/A	N/A	0.015	0.025

Notes:

1. All pixels black.
2. All pixels white.

Typical case:
T_A = 25 °C
VDD = 2.8 V
VDDI = 1.8 V

Worst case:
T_A = 25 °C
VDD = 2.7~3.3V
VDDI = 1.6~3.3V

ST7773

8. Timing chart

8.1 Parallel interface characteristics(8080-series MCU interface): 18, 16, 9 or 8-bits bus

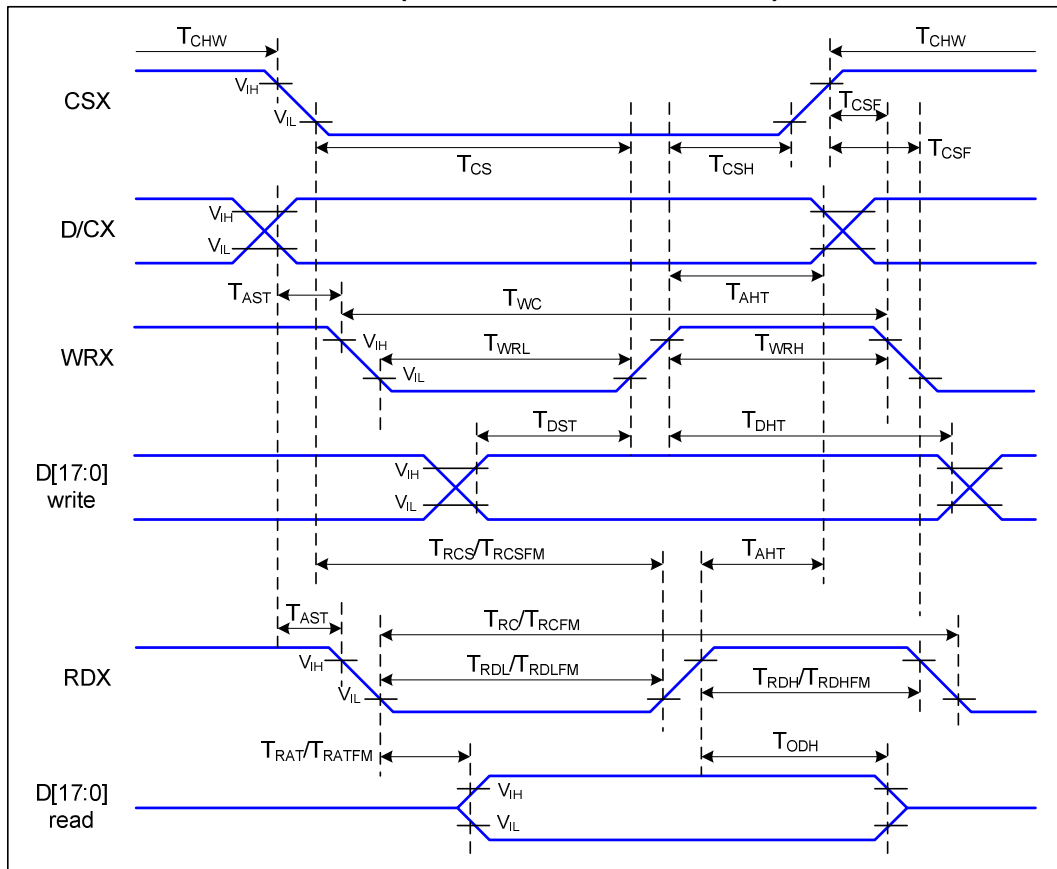

Fig. 8.1.1 Parallel interface timing characteristics (8080-series MCU interface)

Signal	Symbol	Parameter	Min	Max	Unit	Description
D/CX	T_{AST}	Address setup time	10		ns	-
	T_{AHT}	Address hold time (Write/Read)	15		ns	
CSX	T_{CHW}	Chip select "H" pulse width	0		ns	-(3-transfer for one pixel)
	T_{CS}	Chip select setup time (Write)	30		ns	
	T_{RCS}	Chip select setup time (Read ID)	150		ns	
	T_{RCSFM}	Chip select setup time (Read FM)	250		ns	
	T_{CSF}	Chip select wait time (Write/Read)	10		ns	
	T_{CSH}	Chip select hold time	10		ns	
WRX	T_{WC}	Write cycle	100		ns	10MHz
	T_{WRH}	Control pulse "H" duration	40		ns	
	T_{WRL}	Control pulse "L" duration	30		ns	
RDX (ID)	T_{RC}	Read cycle (ID)	160		ns	When read ID data
	T_{RDH}	Control pulse "H" duration (ID)	40		ns	
	T_{RDL}	Control pulse "L" duration (ID)	100		ns	
RDX (FM)	T_{RCFM}	Read cycle (FM)	400		ns	When read from frame memory
	T_{RDHFM}	Control pulse "H" duration (FM)	40		ns	
	T_{RDLFM}	Control pulse "L" duration (FM)	300		ns	
D[17:0]	T_{DST}	Data setup time	10		ns	For maximum CL=30pF
	T_{DHT}	Data hold time	15		ns	
	T_{RAT}	Read access time (ID)		100	ns	
	T_{RATFM}	Read access time (FM)		100	ns	
	T_{ODH}	Output disable time	45	80	ns	

Note 1: $V_{DD1}=1.6$ to $3.3V$, $V_{DD}=2.7$ to $3.3V$, $AGND=DGND=0V$, $T_a=25\text{ }^{\circ}\text{C}$

Fig. 8.1.2 Rising and falling timing for input and output signal

Fig.8.1.3 Chip selection (CSX) timing

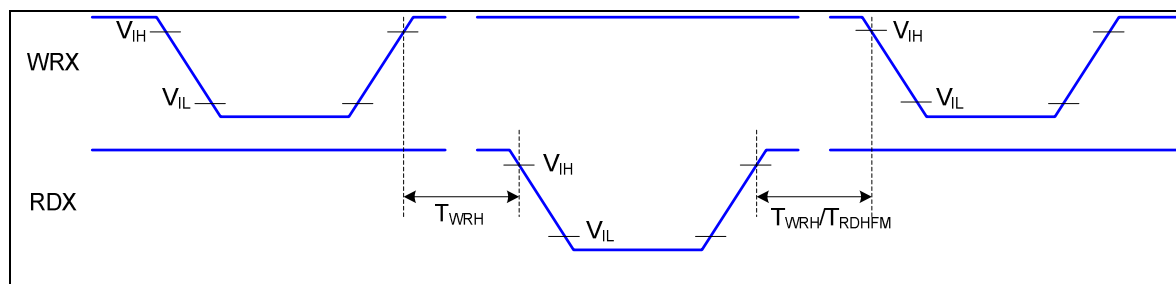

Fig. 8.1.4 Write-to-read and read-to-write timing

NOTE: The rising time and falling time (T_R , T_F) of input signal are specified at 15 ns or less. Logic high and low levels are specified as 30% and 70% of V_{DDI} for Input signals.

ST7773

8.3 Serial interface characteristics (3-line serial)

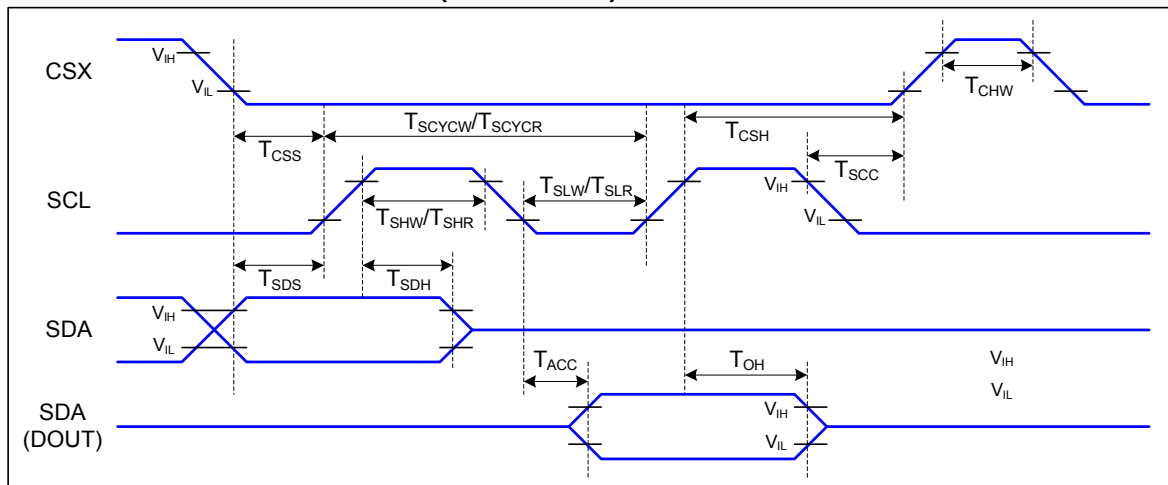

Fig. 8.3.1 3-line serial interface timing

Signal	Symbol	Parameter	Min	Max	Unit	Description
CSX	T _{CSS}	Chip select setup time	60		ns	
	T _{CSH}	Chip select hold time	60		ns	
	T _{SCC}	Chip select setup time	10		ns	
	T _{CHW}	Chip select hold time	10		ns	
SCL	T _{SCYCW}	Serial clock cycle (Write)	65		ns	
	T _{SHW}	SCL "H" pulse width (Write)	20		ns	
	T _{SLW}	SCL "L" pulse width (Write)	40		ns	
	T _{SCYCR}	Serial clock cycle (Read)	150		ns	
	T _{SHR}	SCL "H" pulse width (Read)	60		ns	
	T _{SLR}	SCL "L" pulse width (Read)	80		ns	
SDA (DIN) (DOUT)	T _{SDS}	Data setup time	10		ns	For maximum CL=30pF
	T _{SDH}	Data hold time	15		ns	
	T _{ACC}	Access time		80	ns	
	T _{OH}	Output disable time	45	80	ns	

Table 8.3: 3-line Serial Interface Characteristics

Note 1: VDDI=1.6 to 3.3V, VDD=2.7 to 3.3V, AGND=DGND=0V, Ta=25°C

Note 2: The rising time and falling time (Tr, Tf) of input signal are specified at 15 ns or less. Logic high and low levels are specified as 30% and 70% of VDDI for Input signals.

ST7773

9. Function description

9.1 Interface type selection

The selection of given interfaces are done by setting IM2, IM1, and IM0 pins as shown in following table.

Table 9.1.1 Selection of MCU interface

IM2	IM1	IM0	Interface	Read back selection
0	-	-	3-line serial interface	Via the read instruction
1	0	0	8080 MCU 8-bit parallel	RDX strobe (8-bit read data and 8-bit read parameter)
1	0	1	8080 MCU 16-bit parallel	RDX strobe (16-bit read data and 8-bit read parameter)
1	1	0	8080 MCU 9-bit parallel	RDX strobe (9-bit read data and 8-bit read parameter)
1	1	1	8080 MCU 18-bit parallel	RDX strobe (18-bit read data and 8-bit read parameter)

Table 9.1.2 Pin connection according to various MCU interface

IM2	IM1	IM0	Interface	RDX	WRX	D/CX	Read back selection
0	-	-	3-line serial interface	Note1	Note1	SCL	D[17:1]: unused, D0: SDA
1	0	0	8080 8-bit parallel	RDX	WRX	D/CX	D[17:8]: unused, D7-D0: 8-bit data
1	0	1	8080 16-bit parallel	RDX	WRX	D/CX	D[17:16]: unused, D15-D0: 16-bit data
1	1	0	8080 9-bit parallel	RDX	WRX	D/CX	D[17:9]: unused, D8-D0: 9-bit data
1	1	1	8080 18-bit parallel	RDX	WRX	D/CX	D17-D0: 18-bit data

Note 1. Unused pins must be connected to DGND or VDDI.

9.2 Write cycle sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control signals (D/CX, RDX, WRX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (= '0') and vice versa it is data (= '1').

Fig. 9.2.1 8080-series WRX protocol

Note: WRX is an unsynchronized signal (It can be stopped).

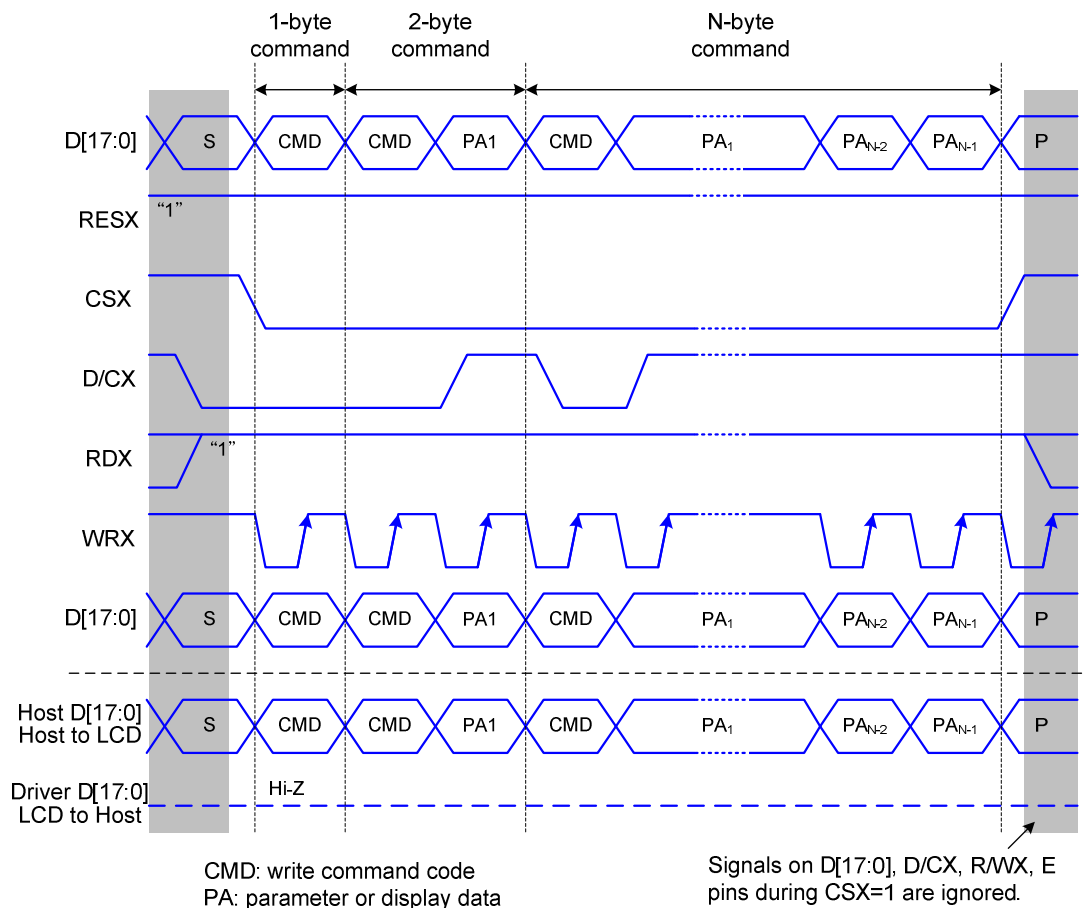

Fig. 9.2.2 8080-series parallel bus protocol, write to register or display RAM

9.3 Read cycle sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from LCD driver via interface. The driver sends data (D[17:0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

Fig. 9.2.3 8080-series RDX protocol

Note: RDX is an unsynchronized signal (It can be stopped).

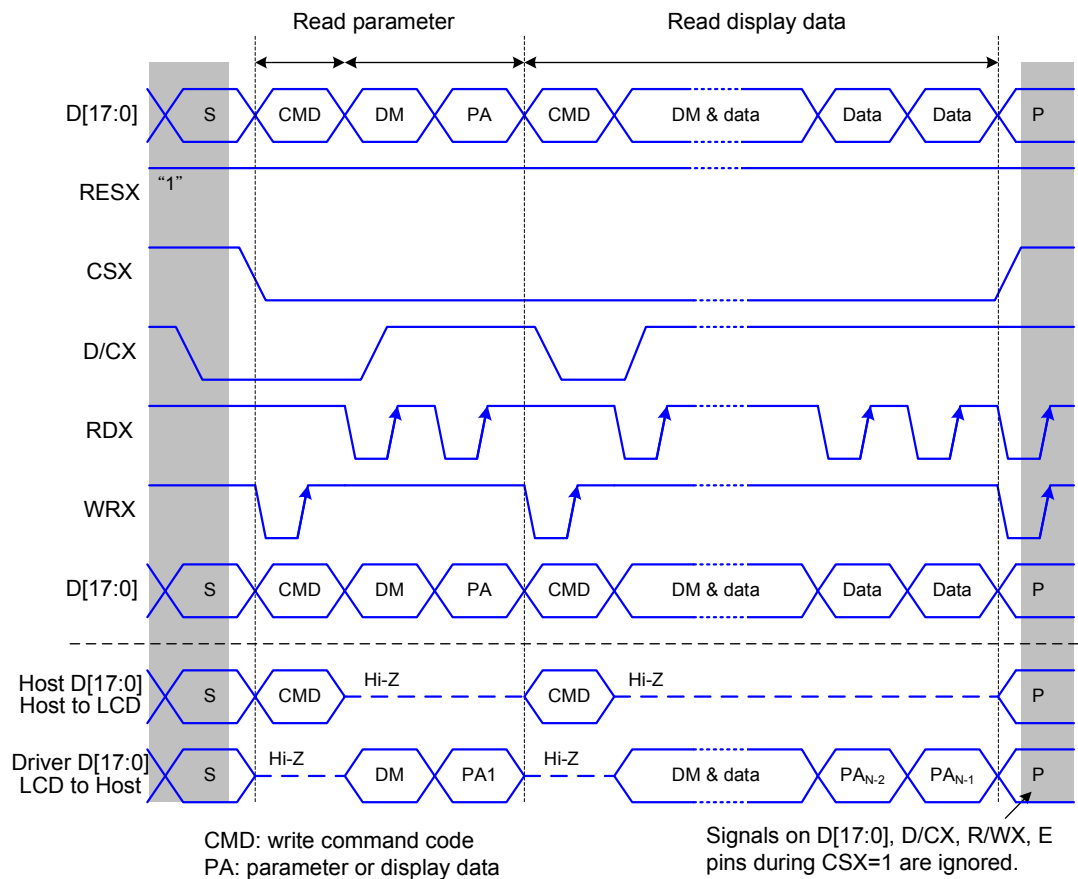

Fig. 9.2.4 8080-series parallel bus protocol, read data from register or display RAM

ST7773

9.4 Serial interface

The selection of this interface is done by IM2="Low".

The serial interface is either 3-lines/9-bits bi-directional interface for communication between the micro controller and the LCD driver. The 3-lines serial interface use: CSX (chip enable), SCL (serial clock) and SDA (serial data input/output), Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

9.4.1 Command Write Mode

The write mode of the interface means the micro controller writes commands and data to the LCD driver. 3-lines serial data packet contains a control bit D/CX and a transmission byte. Any instruction can be sent in any order to the driver. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

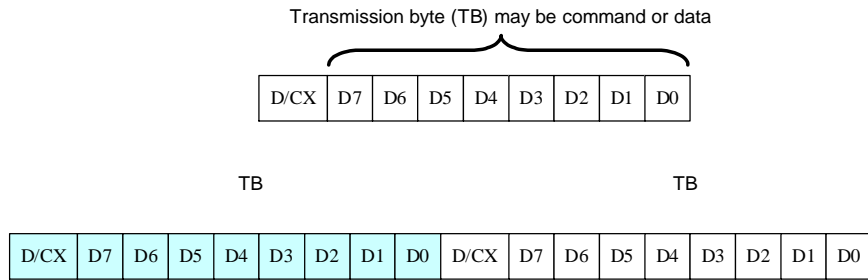

Fig. 9.4.1 Serial interface data stream format

When CSX is “high”, SCL clock is ignored. During the high period of CSX the serial interface is initialized. At the falling edge of CSX, SCL can be high or low (see Fig 9.4.2). SDA is sampled at the rising edge of SCL. D/CX indicates whether the byte is command (D/CX=’0’) or parameter/RAM data (D/CX=’1’). D/CX is sampled when first rising edge of SCL. If CSX stays low after the last bit of command/data byte, the serial interface expects the D/CX bit of the next byte at the next rising edge of SCL.

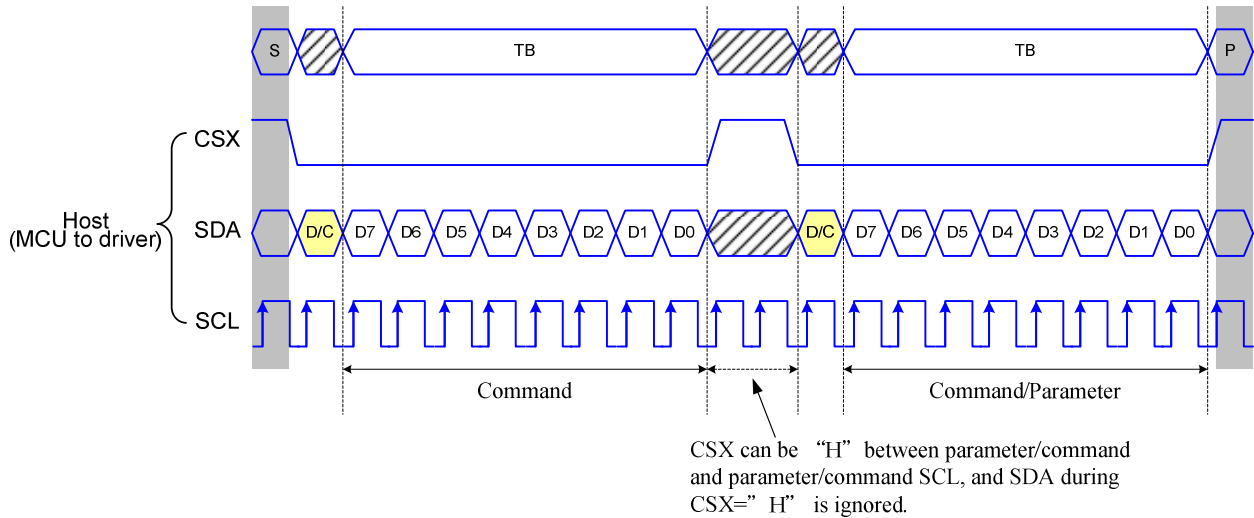

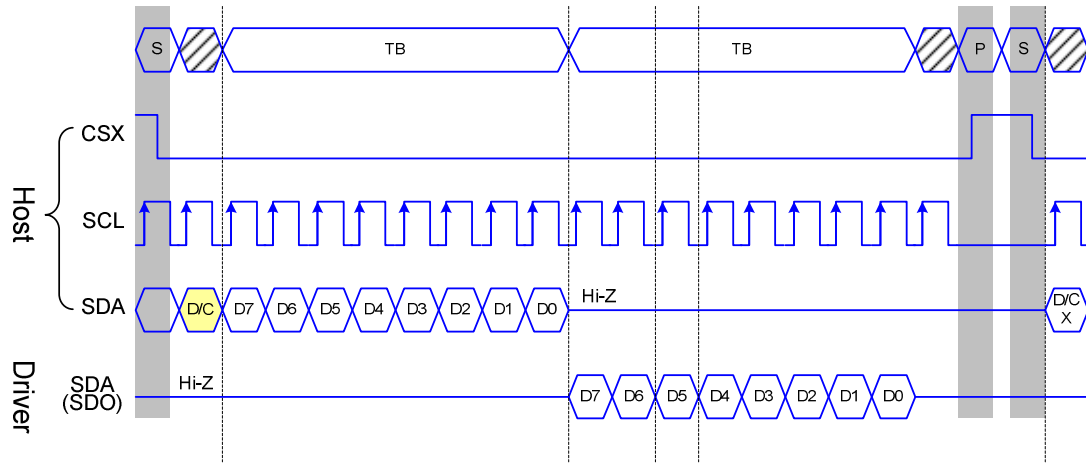

Fig. 9.4.2 3-line serial interface write protocol (write to register with control bit in transmission)

9.4.2 Read Functions

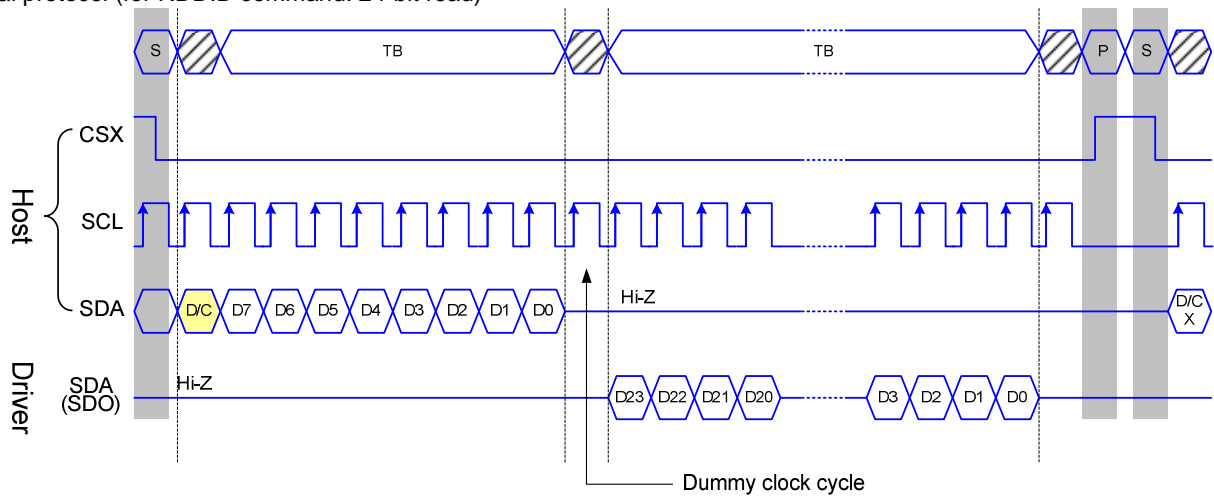

The read mode of the interface means that the micro controller reads register value from the driver. To achieve read function, the micro controller first has to send a command (read ID or register command) and then the following byte is transmitted in the opposite direction. After that CSX is required to go to high before a new command is send (see the below figure). The driver samples the SDA (input data) at rising edge of SCL, but shifts SDA (output data) at the falling edge of SCL. Thus the micro controller is supported to read at the rising edge of SCL.

After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit.

Serial protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command: 8-bit read):

Serial protocol (for RDDID command: 24-bit read)

Serial Protocol (for RDDST command: 32-bit read)

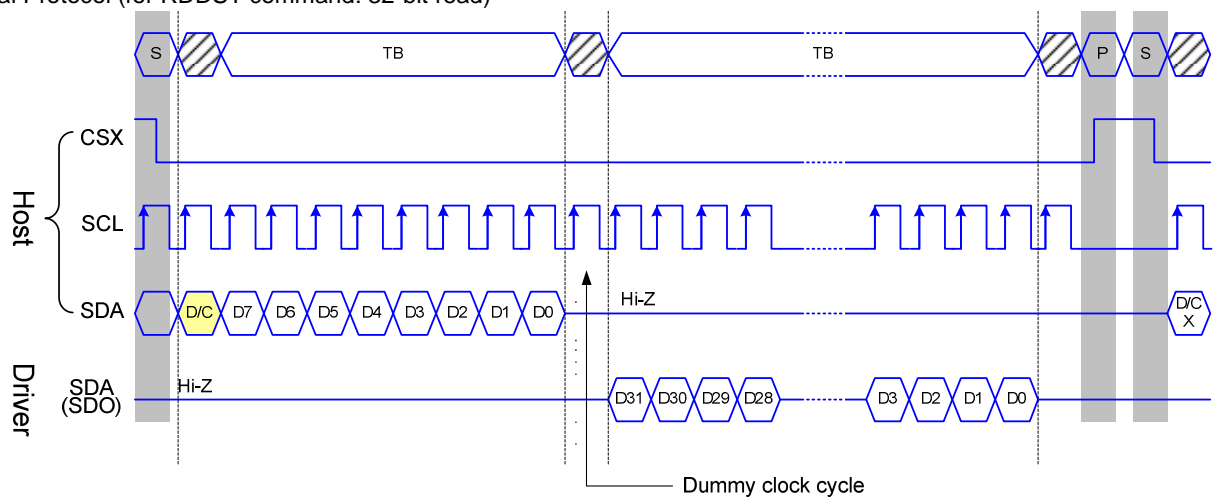

Fig. 9.4.4 3-line serial interface read protocol

ST7773

9.5 Data Transfer Break and Recovery

If there is a break in data transmission by RESX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been HIGH state. See the following example

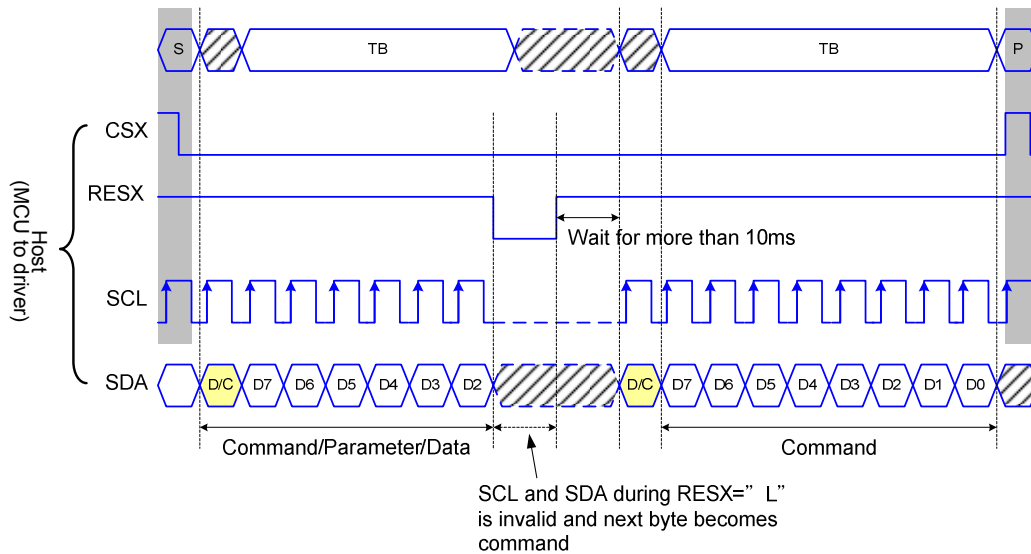

Fig. 9.5.1 Serial bus protocol, write mode – interrupted by RESX

If there is a break in data transmission by CSX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following example

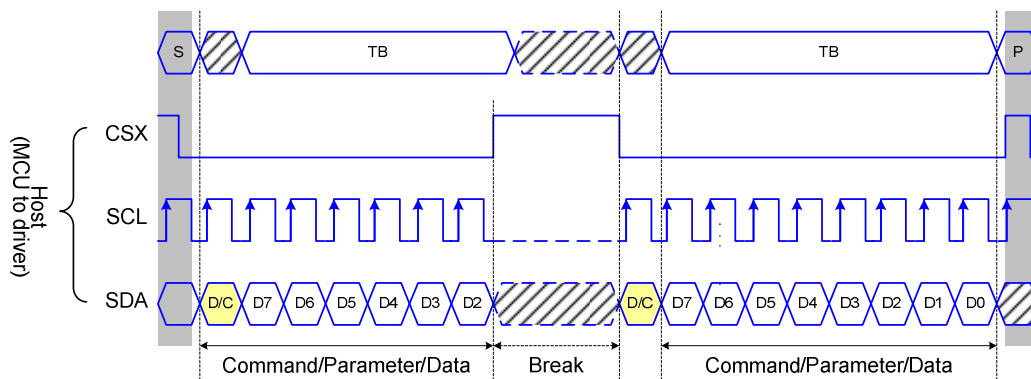

Fig. 9.5.2 Serial bus protocol, write mode – interrupted by CSX

If 1, 2 or more parameter commands are being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

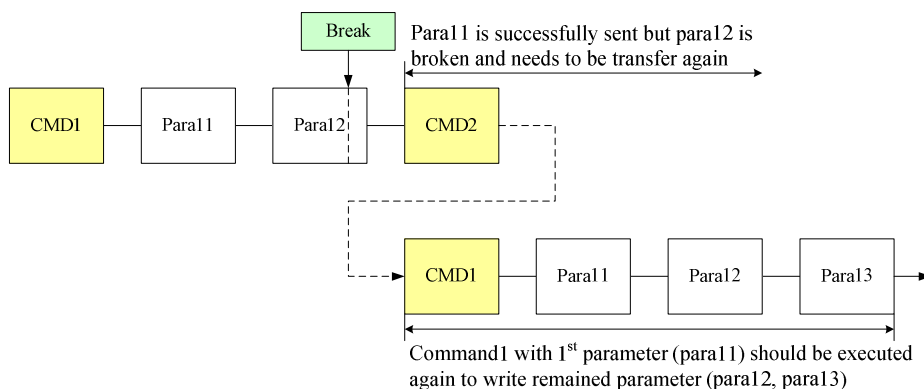

Fig.9.5.3 Write interrupts recovery (serial interface)

ST7773

If a 2 or more parameter commands are being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

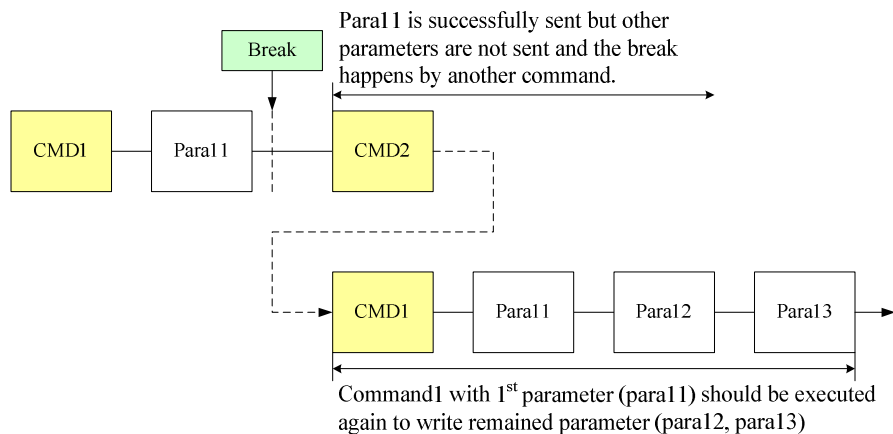

Fig. 9.5.4 Write interrupts recovery (both serial and parallel Interface)

9.6 Data transfer pause

It will be possible when transferring a command, frame memory data or multiple parameter data to invoke a pause in the data transmission. If the chip select line is released after a whole byte of a frame memory data or multiple parameter data has been completed, then driver will wait and continue the frame memory data or parameter data transmission from the point where it was paused. If the chip select Line is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the chip select line is next enabled as shown below.

This applies to the following 4 conditions:

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

9.6.1 Serial interface pause

ST7773

9.6.2 Parallel interface pause

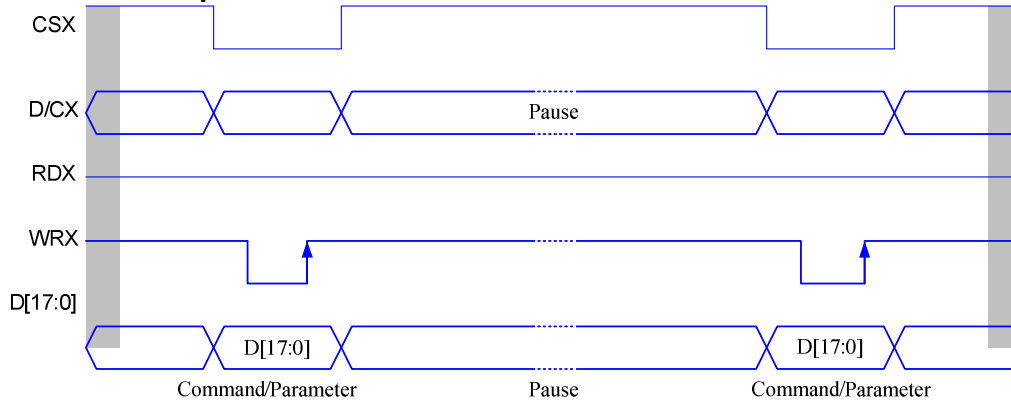

Fig. 9.6.2 Parallel bus pause protocol (paused by CSX)

9.7 Data Transfer Modes

The module has three kinds color modes for transferring data to the display RAM. These are 12-bits color per pixel, 16-bits color per pixel and 18-bits color per pixel. The data format is described for each interface. Data can be downloaded to the frame memory by 2 methods.

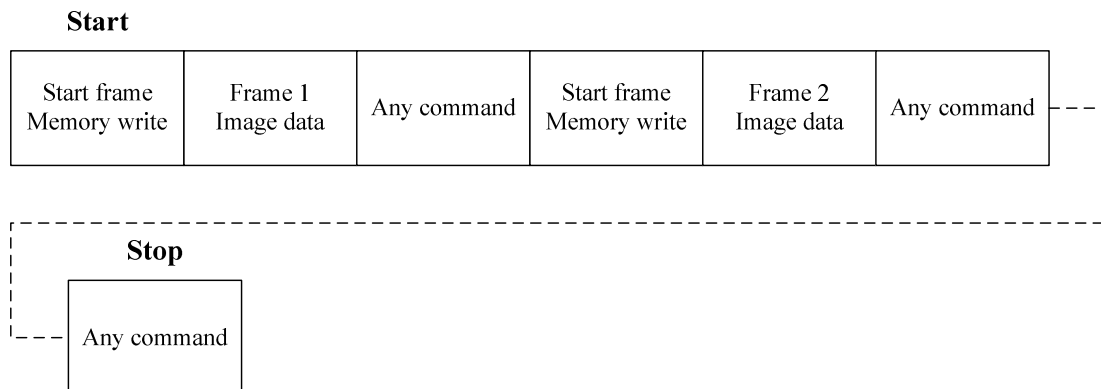

9.7.1 Method 1

The Image data is sent to the frame memory in successive frame writes, each time the frame memory is filled, the frame memory pointer is reset to the start point and the next frame is written.

9.7.2 Method 2

Image data is sent and at the end of each frame memory download, a command is sent to stop frame memory write. Then start memory write command is sent, and a new frame is downloaded.

Note:

- 1) These apply to all data transfer Color modes on both serial and parallel interfaces.
- 2) The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

ST7773

9.8 Data Color Coding

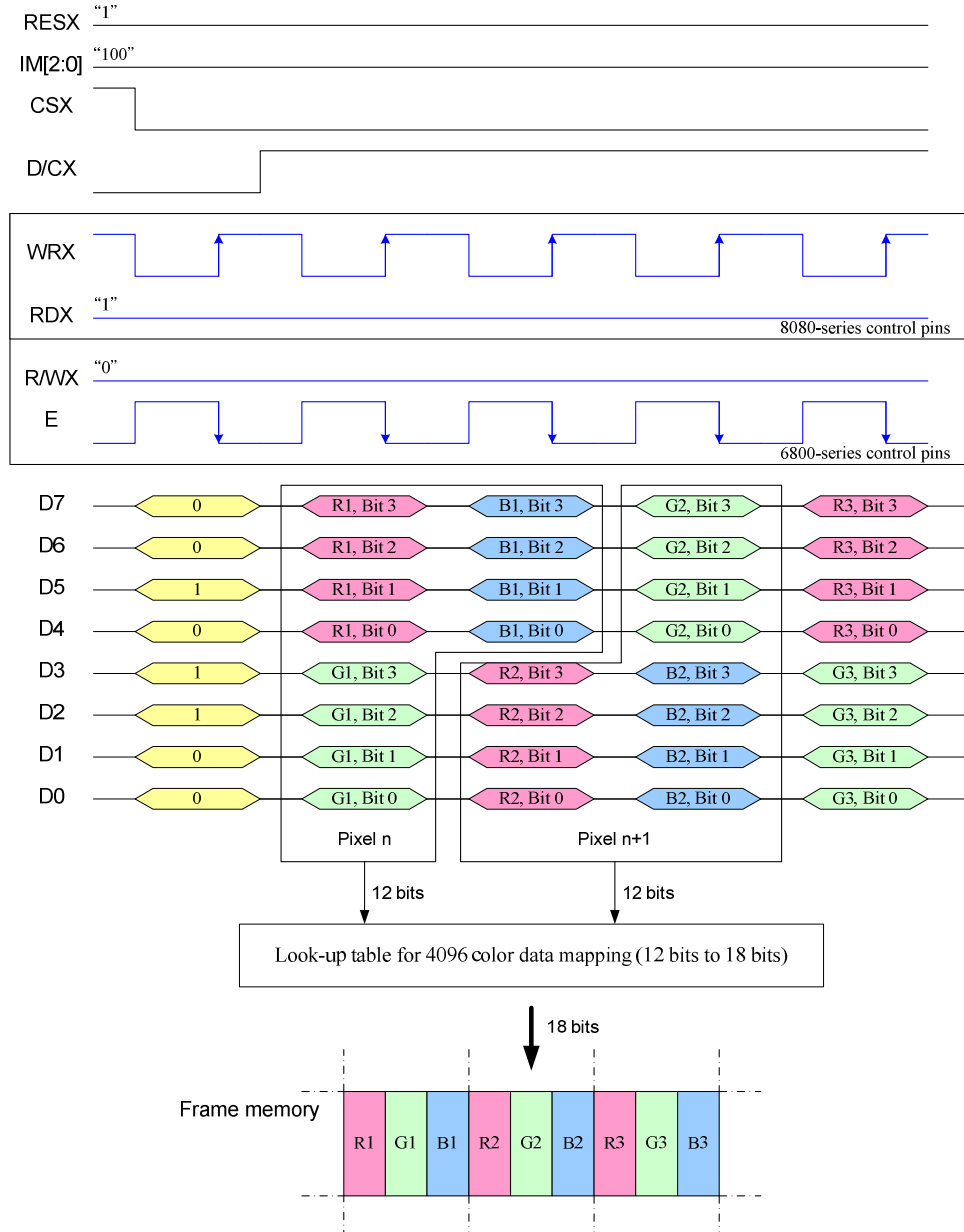

9.8.1 8-bit Parallel Interface (IM2, IM1, IM0= "100")

Different display data formats are available for three Colors depth supported by listed below.

- 4k Colors, RGB 4,4,4-bit input,
- 65k Colors, RGB 5,6,5-bit input,
- 262k Colors, RGB 6,6,6-bit input,

9.8.1.1 8-bit data bus for 12-bit/pixel (RGB 4-4-4-bit input), 4K-Colors, 3AH= "03h"

There are 2 pixels (6 sub-pixels) per 3-bytes.

Note1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

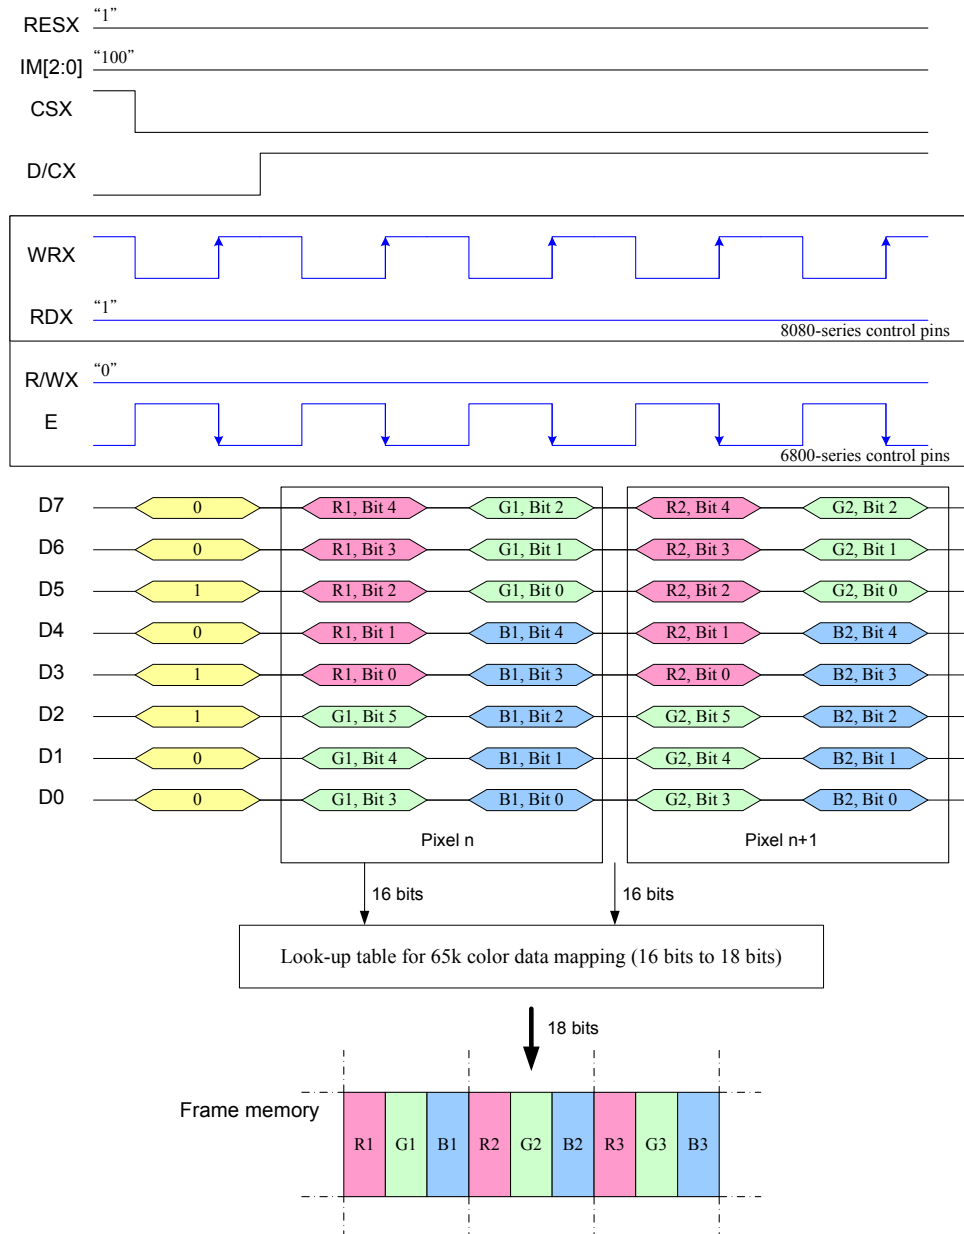

Note 2. 3-time transfer is used to transmit 1 pixel data with the 12-bit color depth information.

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

9.8.1.2 8-bit data bus for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3AH= "05h"

There is 1 pixel (3 sub-pixels) per 2-bytes.

Note1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

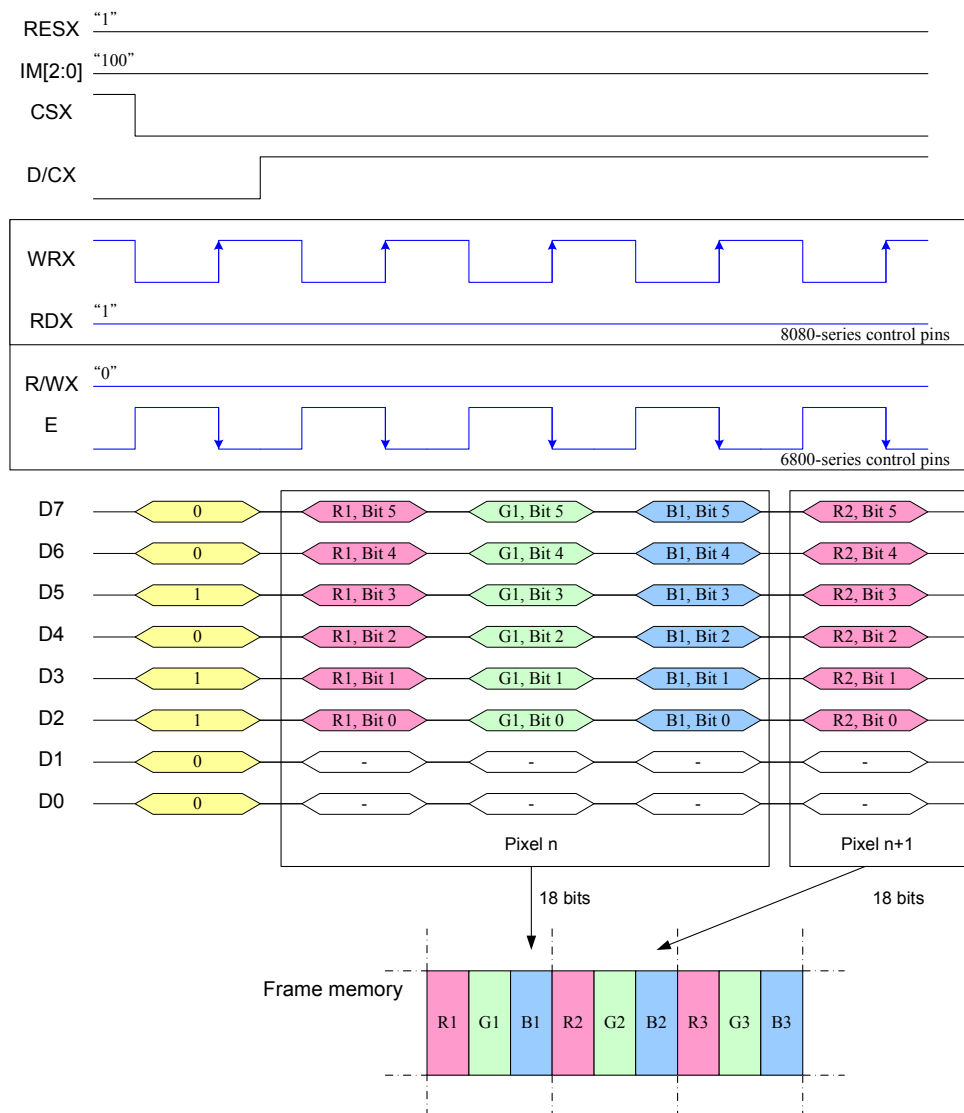

Note 2. 2-times transfer is used to transmit 1 pixel data with the 16-bit color depth information.

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

9.8.1.3 8-bit data bus for 18-bit/pixel (RGB 6-6-6-bit input), 262K-Colors, 3AH= "06h"

There is 1 pixel (3 sub-pixels) per 3-bytes.

Note1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

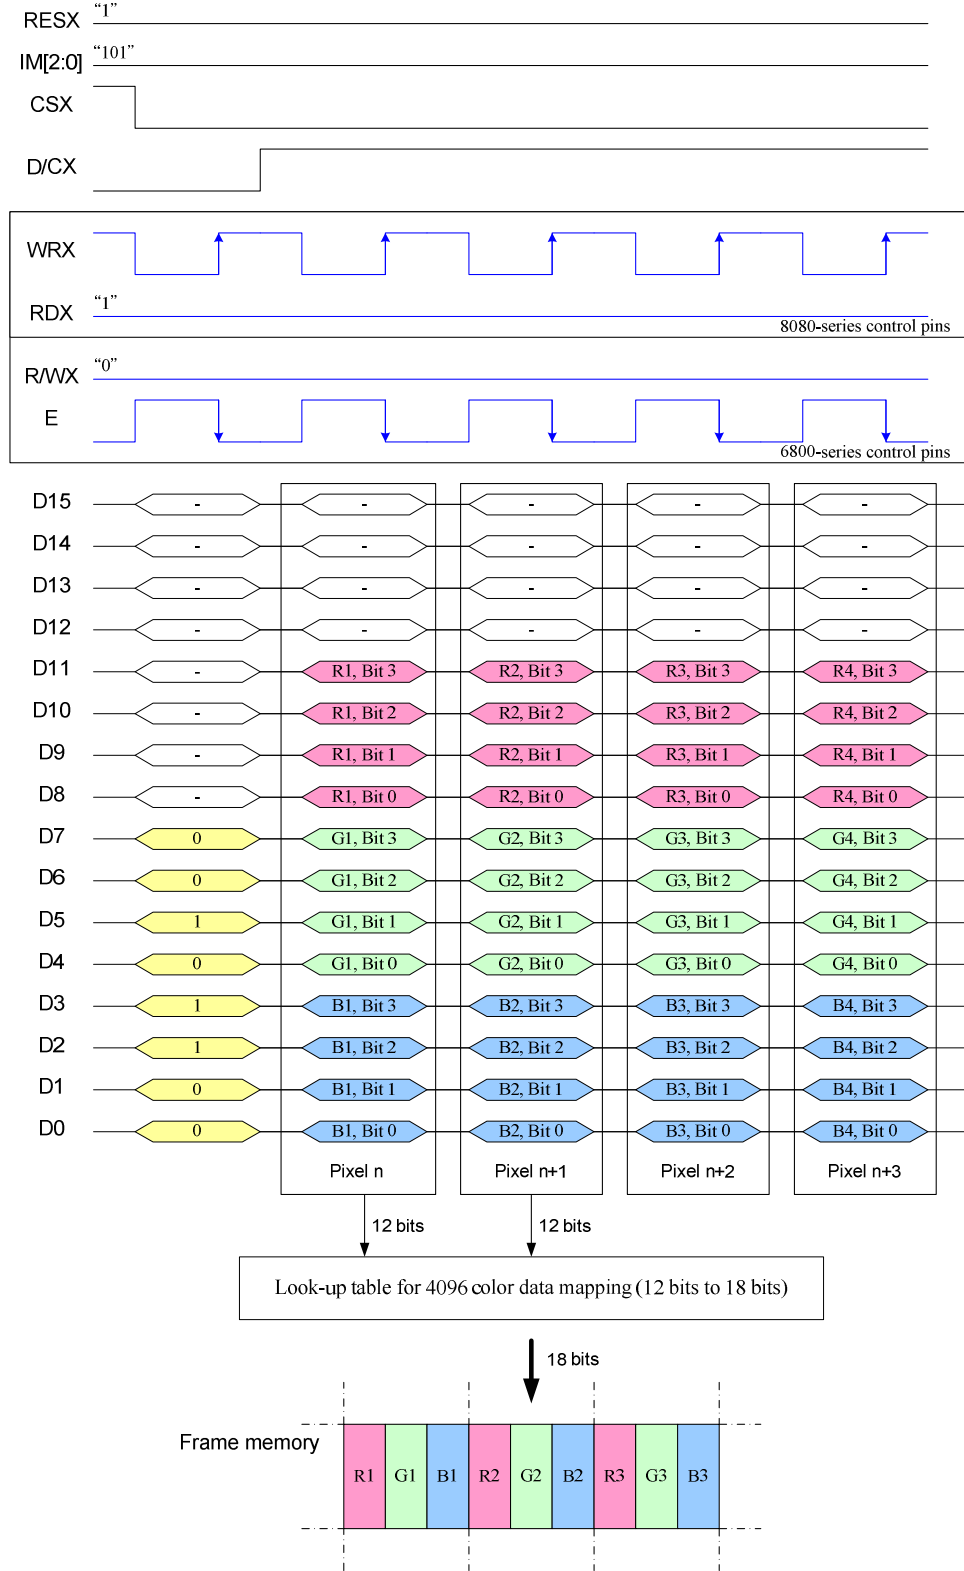

9.8.2 16-Bit Parallel Interface (IM2,IM1, IM0= “101”)

Different display data formats are available for three colors depth supported by listed below.

- 4k colors, RGB 4,4,4-bit input
- 65k colors, RGB 5,6,5-bit input
- 262k colors, RGB 6,6,6-bit input

9.8.2.1 16-bit data bus for 12-bit/pixel (RGB 4-4-4-bit input), 4K-Colors, 3AH= “03h”

There is 1 pixel (3 sub-pixels) per 1 bytes, 12-bit/pixel.

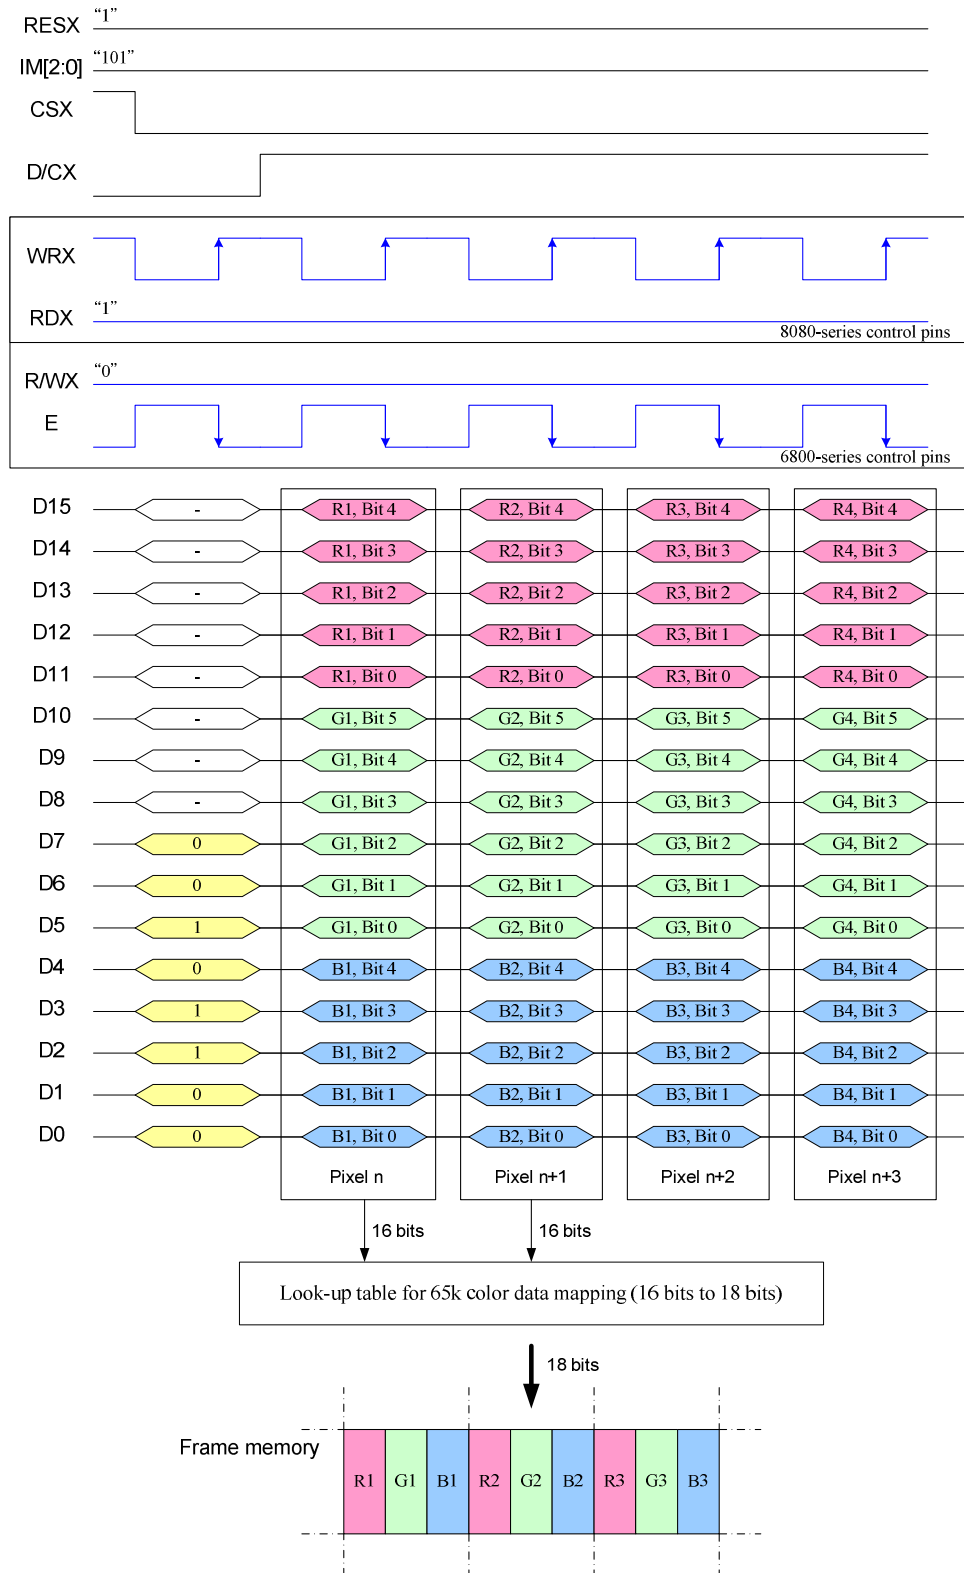

Note1. The data order is as follows, MSB=D11, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer (D11 to D0) is used to transmit 1 pixel data with the 12-bit color depth information.

ST7773

9.8.2.2 16-bit data bus for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3AH= "05h"

There is 1 pixel (3 sub-pixels) per 1 bytes, 16-bit/pixel.

Note1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2. 1-times transfer (D15 to D0) is used to transmit 1 pixel data with the 16-bit color depth information.

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

9.8.2.3 16-bit data bus for 18-bit/pixel (RGB 6-6-6-bit input), 262K-Colors, 3AH= "06h"

There are 2 pixel (6 sub-pixels) per 3 bytes, 18-bit/pixel.

Note1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bits 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2.3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

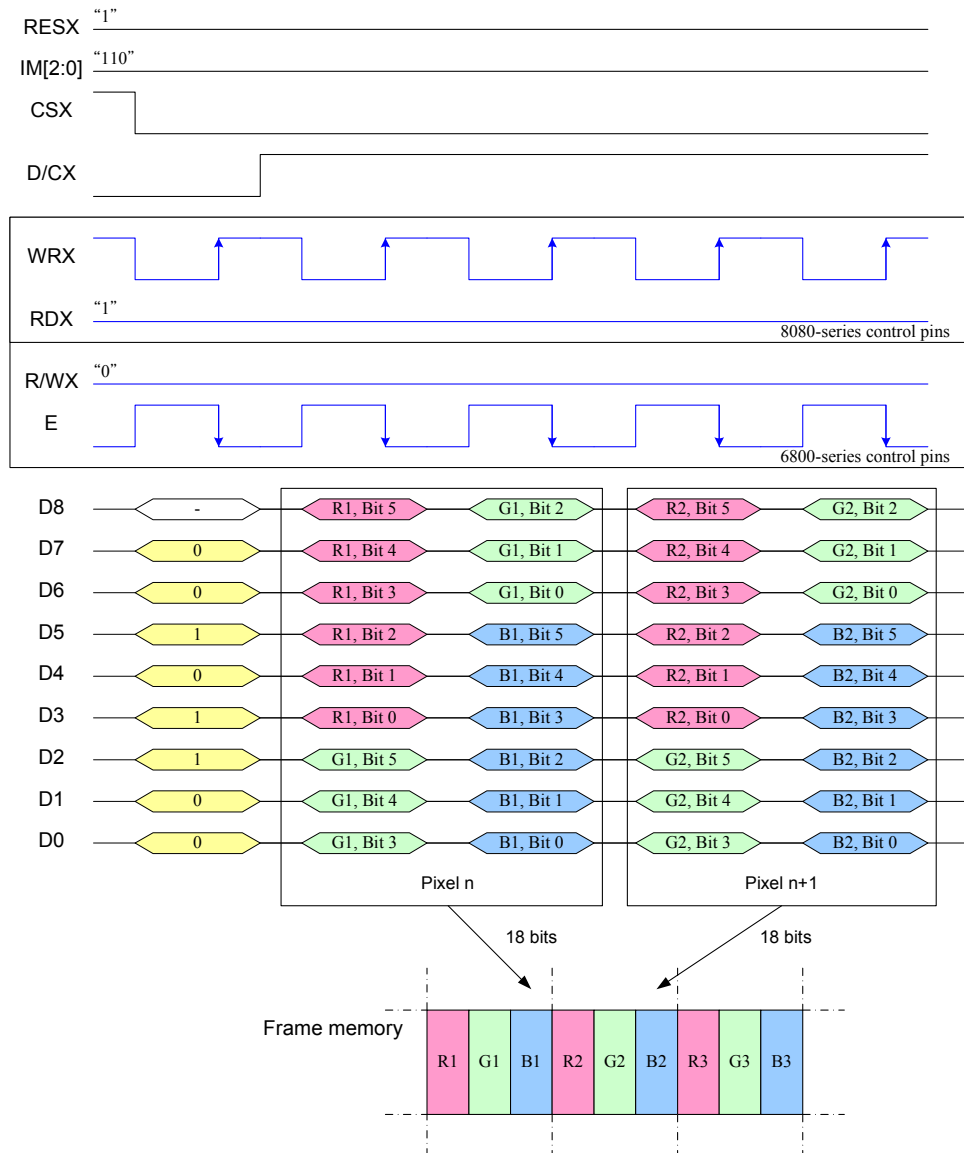

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

9.8.3 9-Bit Parallel Interface (IM2, IM1, IM0="110")

Different display data formats are available for three colors depth supported by listed below.

- 262k colors, RGB 6,6,6-bit input

Note1. The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

Note 3. '-' = Don't care - Can be set to '0' or '1'

ST7773

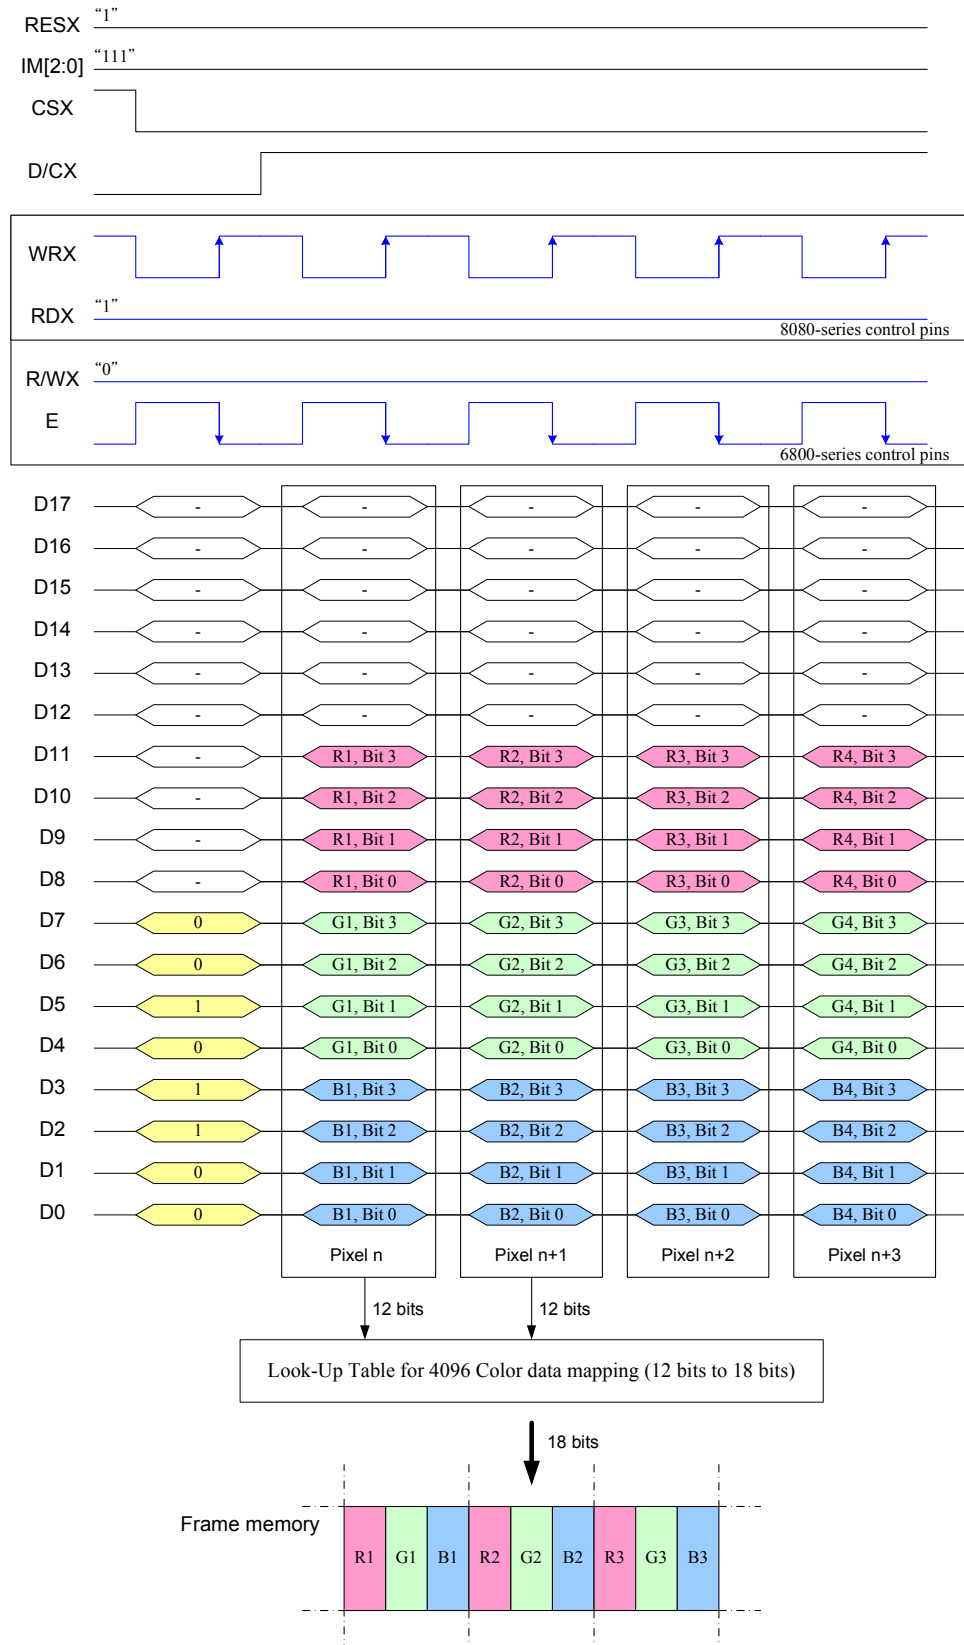

9.8.4 18-Bit Parallel Interface (IM2, IM1, IM0="111")

Different display data formats are available for three colors depth supported by listed below.

- 4k colors, RGB 4,4,4-bit input
- 65k colors, RGB 5,6,5-bit input
- 262k colors, RGB 6,6,6-bit input.

9.8.4.1 18-bit data bus for 12-bit/pixel (RGB 4-4-4-bit input), 4K-Colors, 3AH="03h"

There are 1 pixel (3 sub-pixels) per 1 byte, 12-bit/pixel.

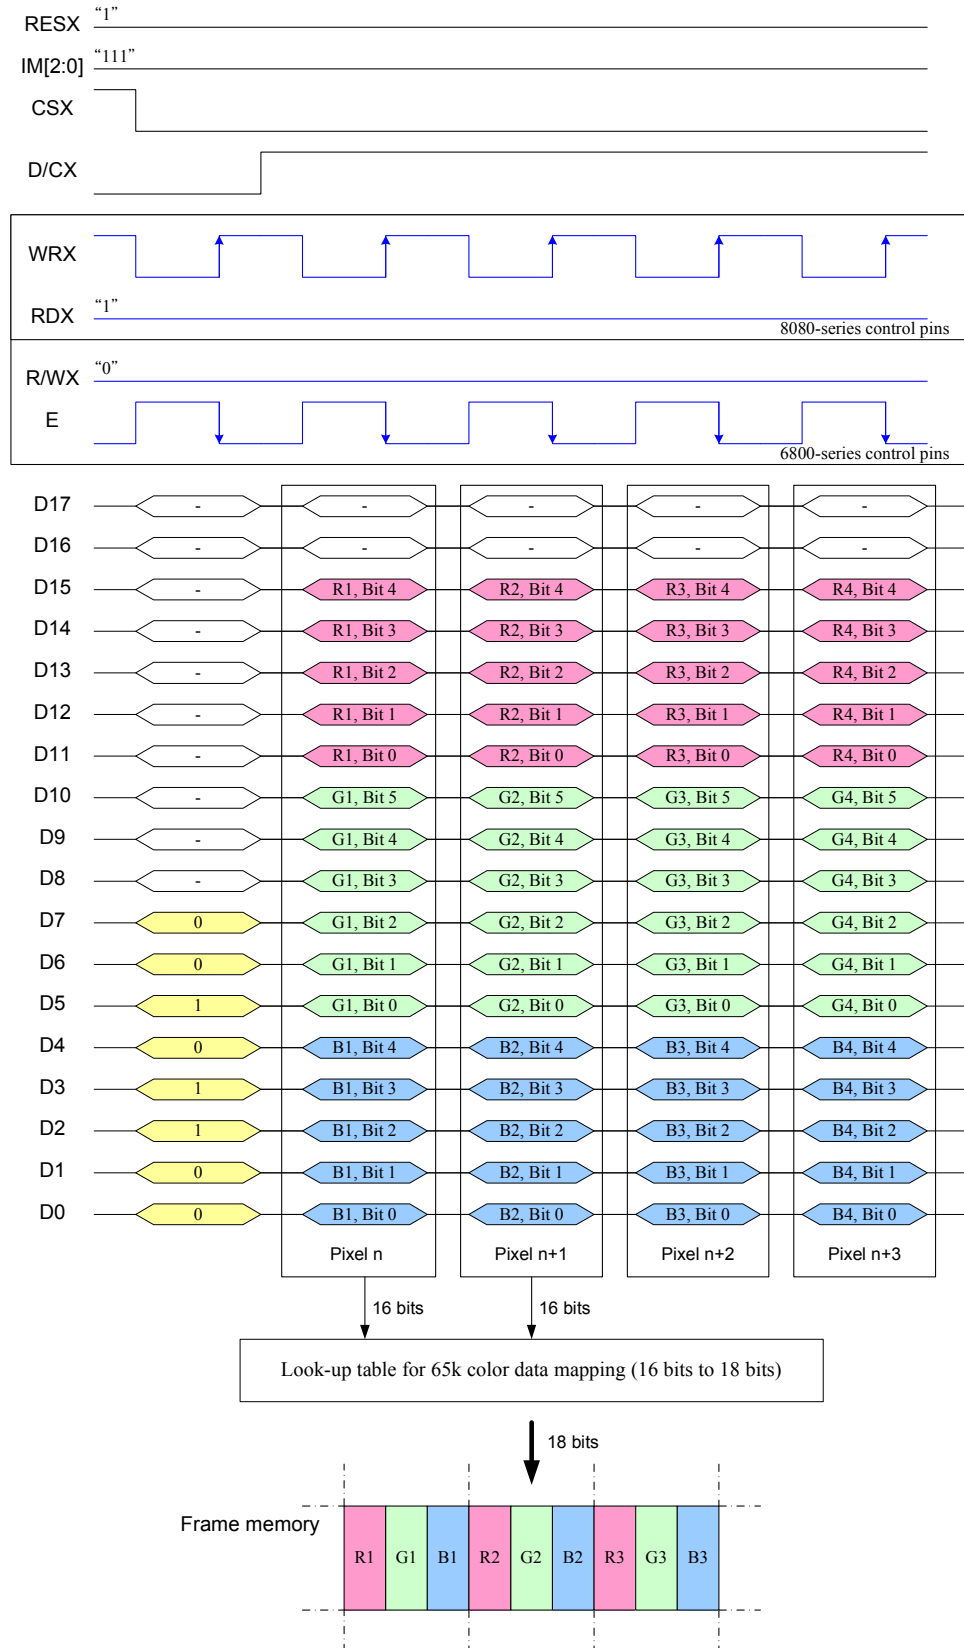

ST7773

Note1. The data order is as follows, MSB=D11, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 12-bit color depth information.

9.8.4.2 18-bit data bus for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3AH="05h"

There are 1 pixel (3 sub-pixels) per 1 byte, 16-bit/pixel.

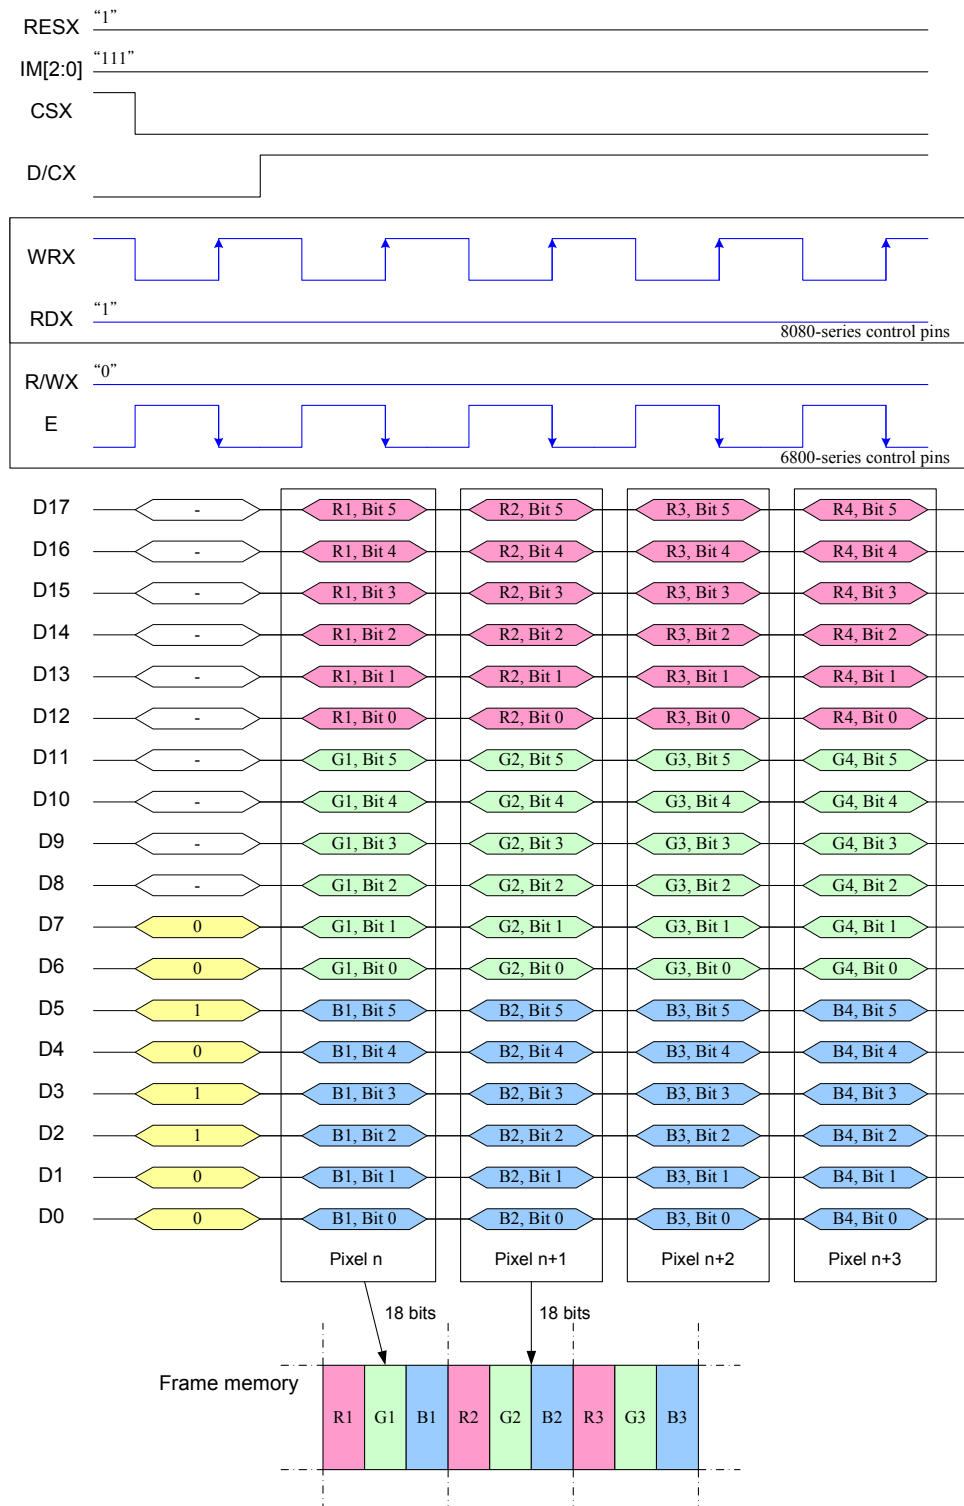

Note1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2.1-times transfer is used to transmit 1 pixel data with the 16-bit color depth information.

9.8.4.3 18-bit data bus for 18-bit/pixel (RGB 6-6-6-bit input), 262K-Colors, 3AH="06h"

There are 1 pixel (3 sub-pixels) per 1 bytes, 18-bit/pixel.

Note1. The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Read, Green and Blue data.

Note 2.1-times transfer (D17o D0) is used to transmit 1 pixel data with the 18-bit color depth information.

$$N$$

ST7773

9.8.5 3-line serial Interface

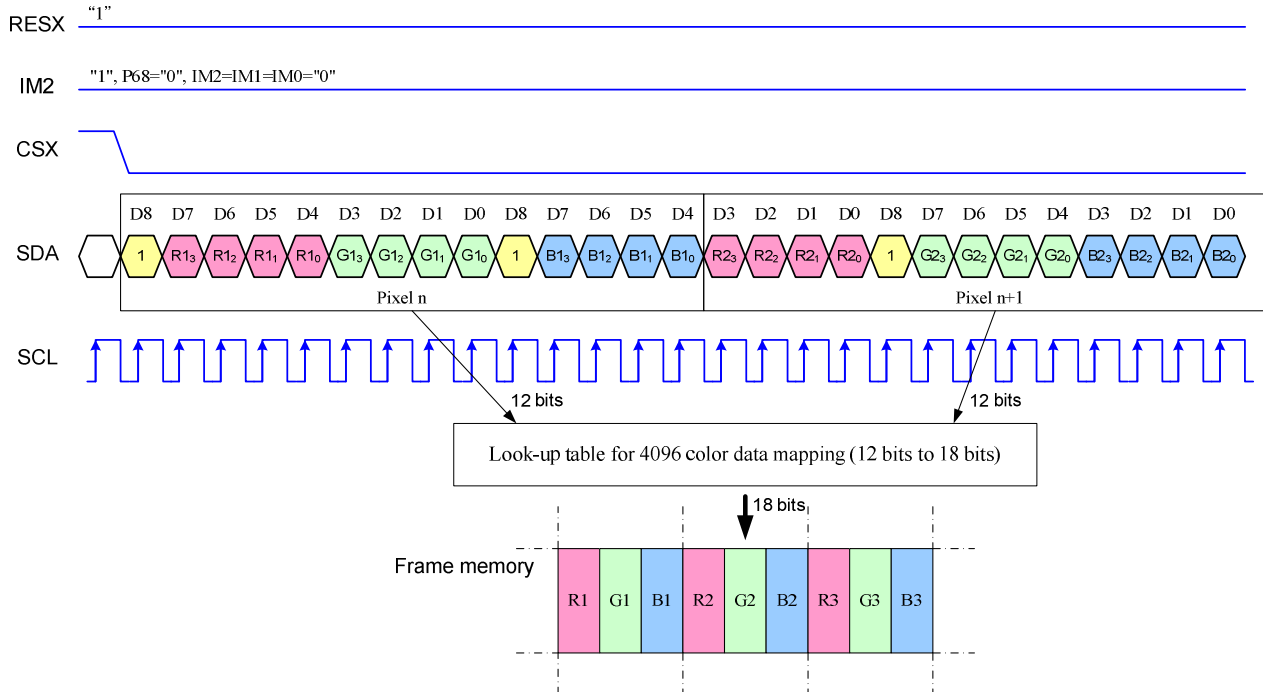

Different display data formats are available for three colors depth supported by the LCM listed below.

4k colors, RGB 4-4-4-bit input

65k colors, RGB 5-6-5-bit input

262k colors, RGB 6-6-6-bit input

9.8.5.1 Write data for 12-bit/pixel (RGB 4-4-4-bit input), 4K-Colors, 3AH="03h"

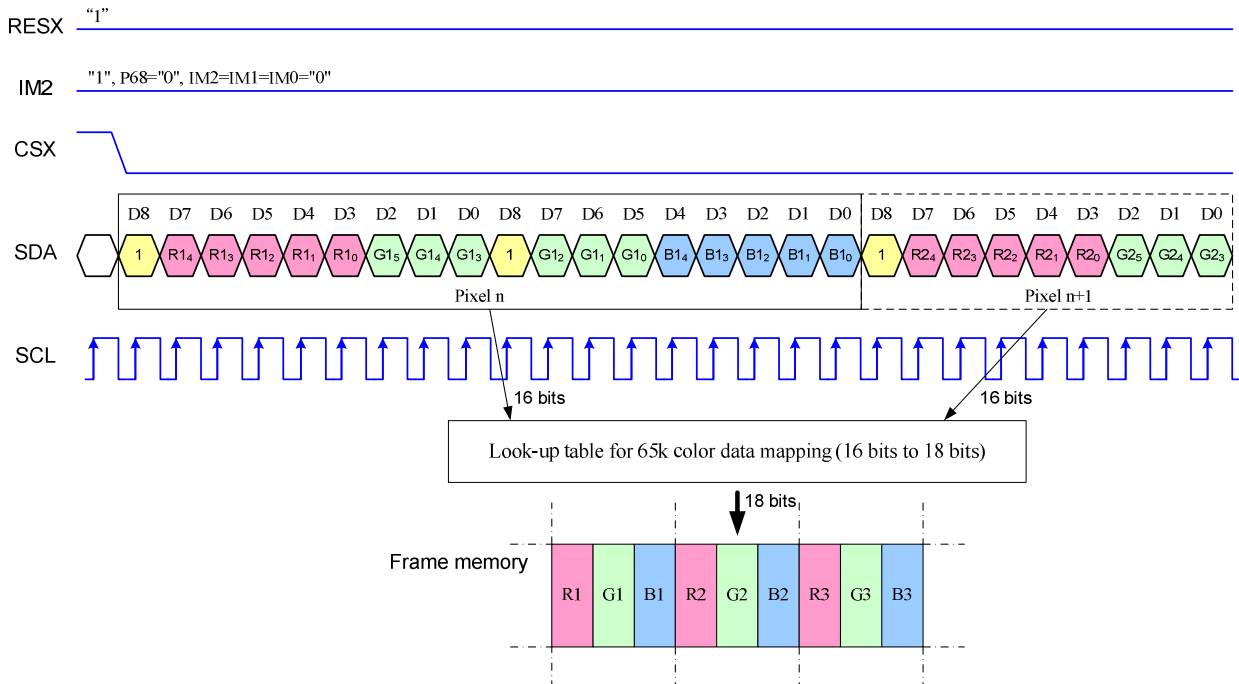

Note 1. pixel data with the 12-bit color depth information

Note 2. The most significant bits are: Rx3, Gx3 and Bx3

Note 3. The least significant bits are: Rx0, Gx0 and Bx0

9.8.5.2 Write data for 16-bit/pixel (RGB 5-6-5-bit input), 65K-Colors, 3AH="05h"

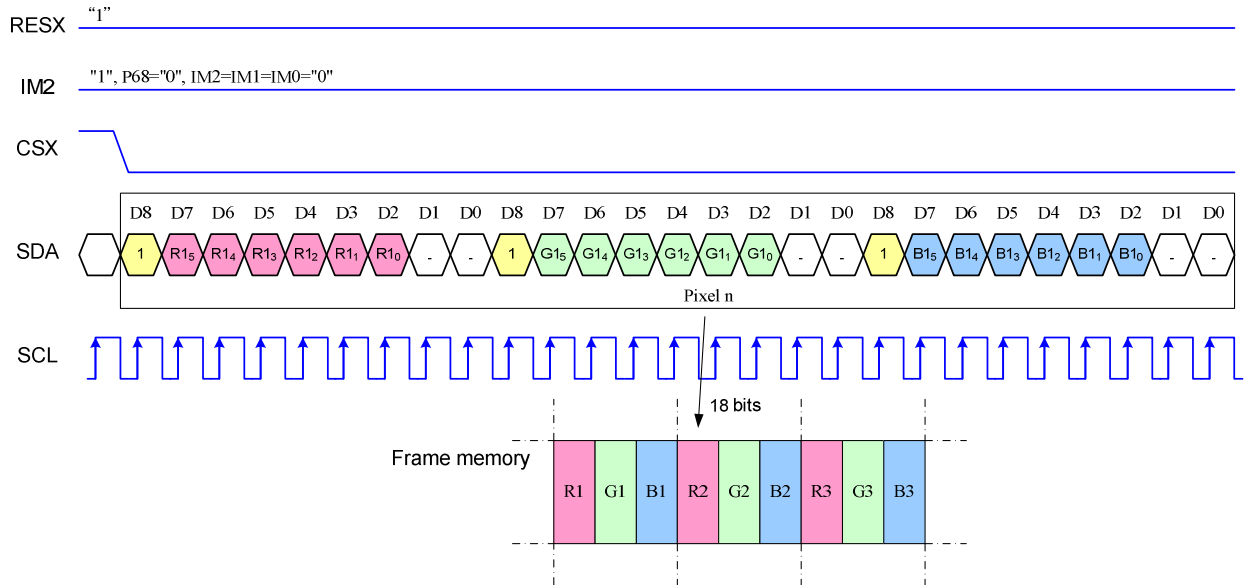

Note 1. pixel data with the 16-bit color depth information

Note 2. The most significant bits are: Rx4, Gx5 and Bx4

Note 3. The least significant bits are: Rx0, Gx0 and Bx0

ST7773

9.8.5.3 Write data for 18-bit/pixel (RGB 6-6-6-bit input), 262K-Colors, 3AH="06h"

Note 1. pixel data with the 18-bit color depth information

Note 2. The most significant bits are: Rx5, Gx5 and Bx5

Note 3. The least significant bits are: Rx0, Gx0 and Bx0

ST7773

9.9 Display Data RAM

9.9.1 Configuration

The display module has an integrated 176x220x18-bit graphic type static RAM. This 696,960-bit memory allows to store on-chip a 176xRGBx220 image with an 18-bpp resolution (262K-color).

There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

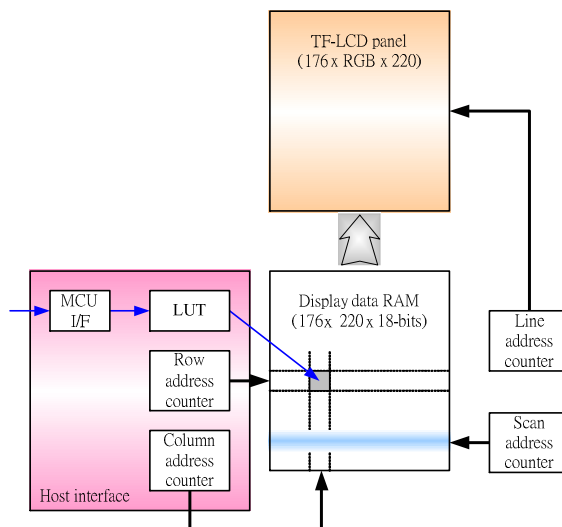

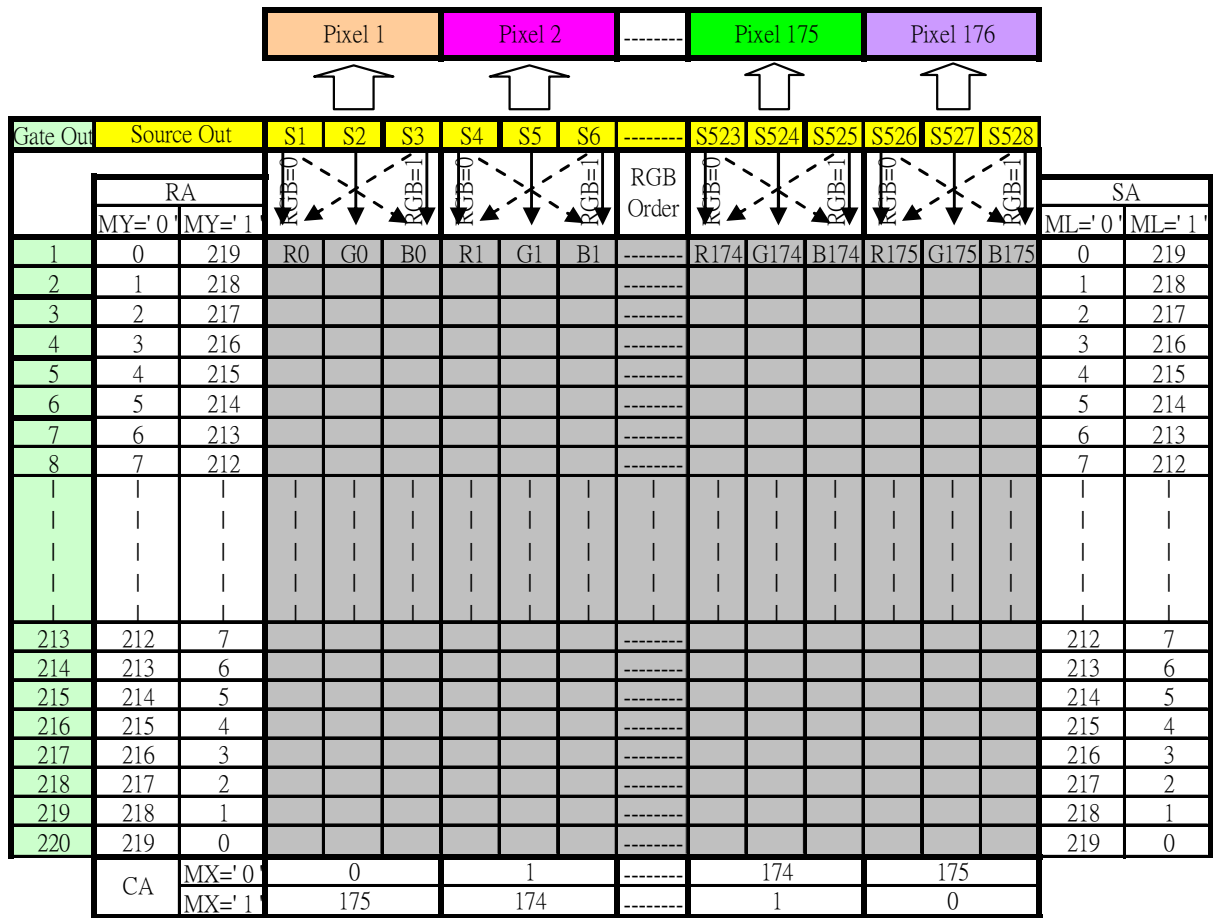

Fig. 9.9.1 Display data RAM organization

ST7773

9.9.2 Memory to Display Address Mapping

Note

RA = Row Address,

CA = Column Address

SA = Scan Address

MX = Mirror X-axis (Column address direction parameter), D6 parameter of MADCTL command

MY = Mirror Y-axis (Row address direction parameter), D7 parameter of MADCTL command

MX = Scan direction parameter, *D4* parameter of MADCTL command

RGB = Red, Green and Blue pixel position change, D3 parameter of MADCTL command

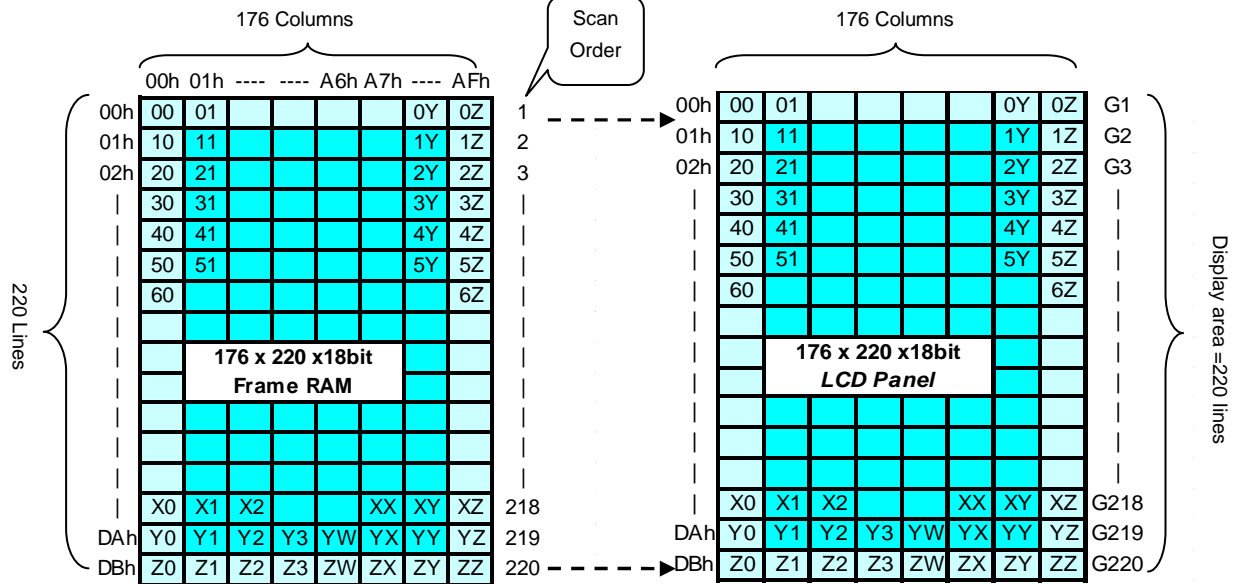

ST7773

9.9.3 Normal Display On or Partial Mode On, Vertical Scroll Off

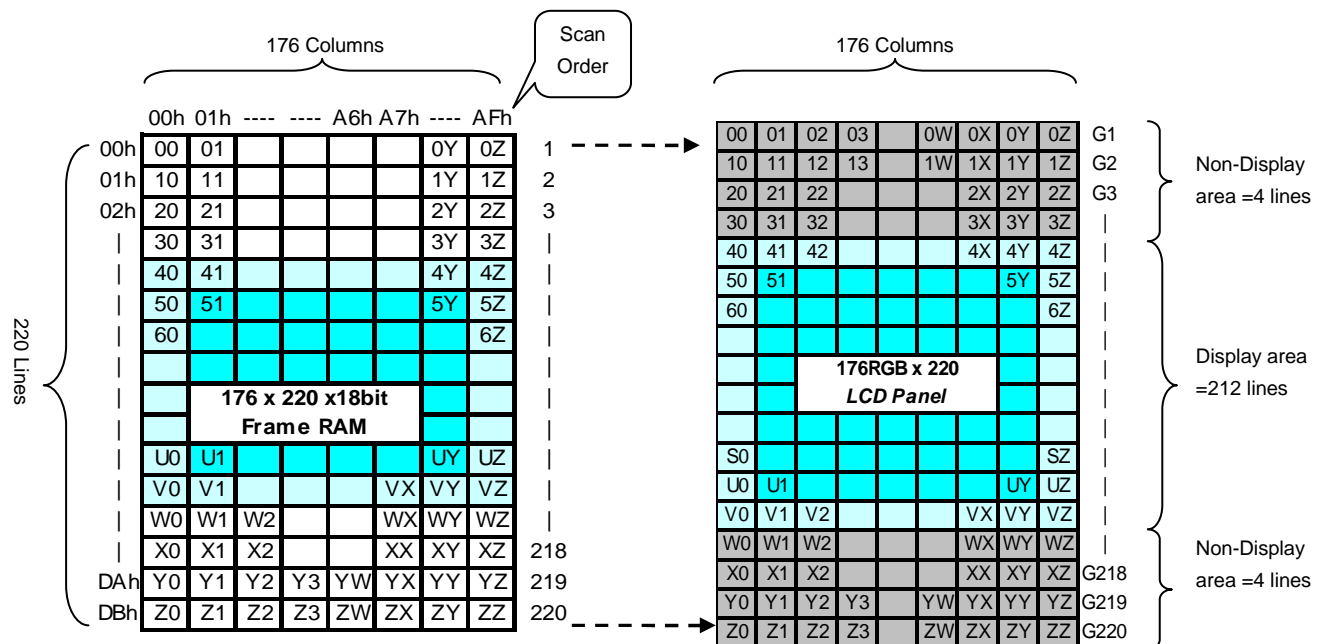

In this mode, contents of the frame memory within an area where column pointer is 00h to AFh and page pointer is 00h to DBh is displayed.

To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

1). Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

2). Example for Partial Display On (PSL[7:0]=04h, PEL[7:0]=D7h, MX=MV=ML='0', SMX=SMY='0')

ST7773

9.9.4 Vertical Scroll Mode

There is vertical scrolling, which are determined by the commands “Vertical Scrolling Definition” (33h) and Vertical Scrolling Start Address” (37h).

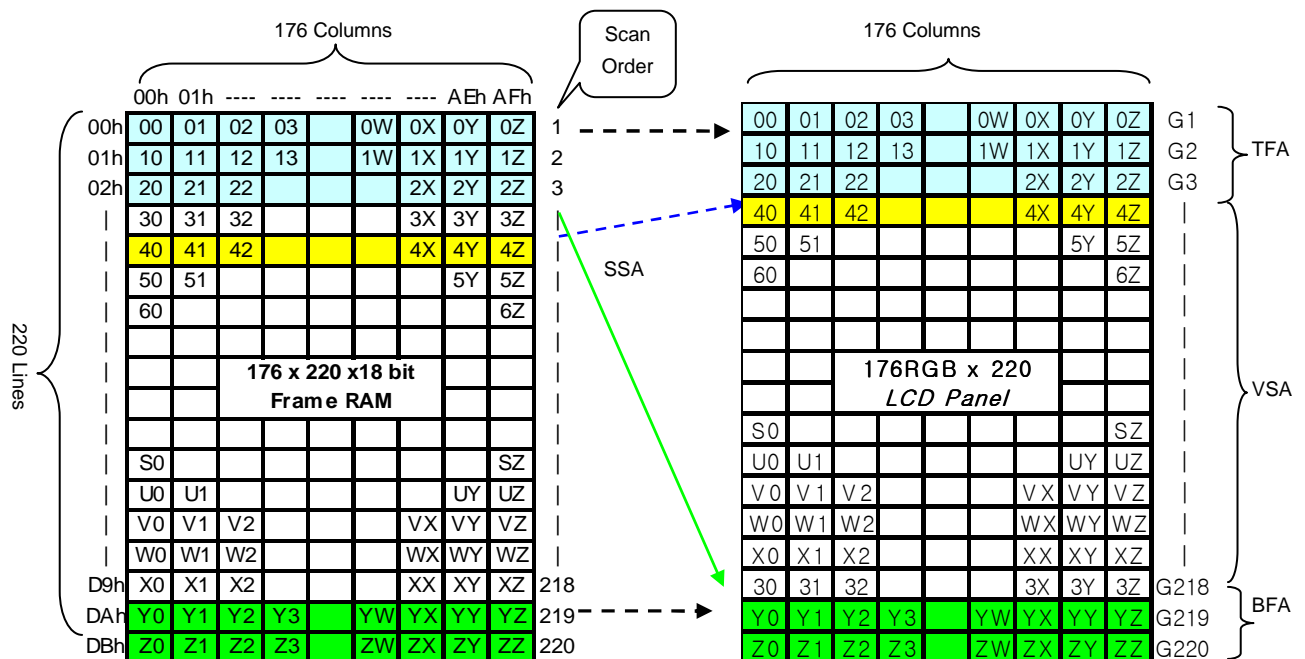

Fig. 9.9.2 Difference between Scrolling and original

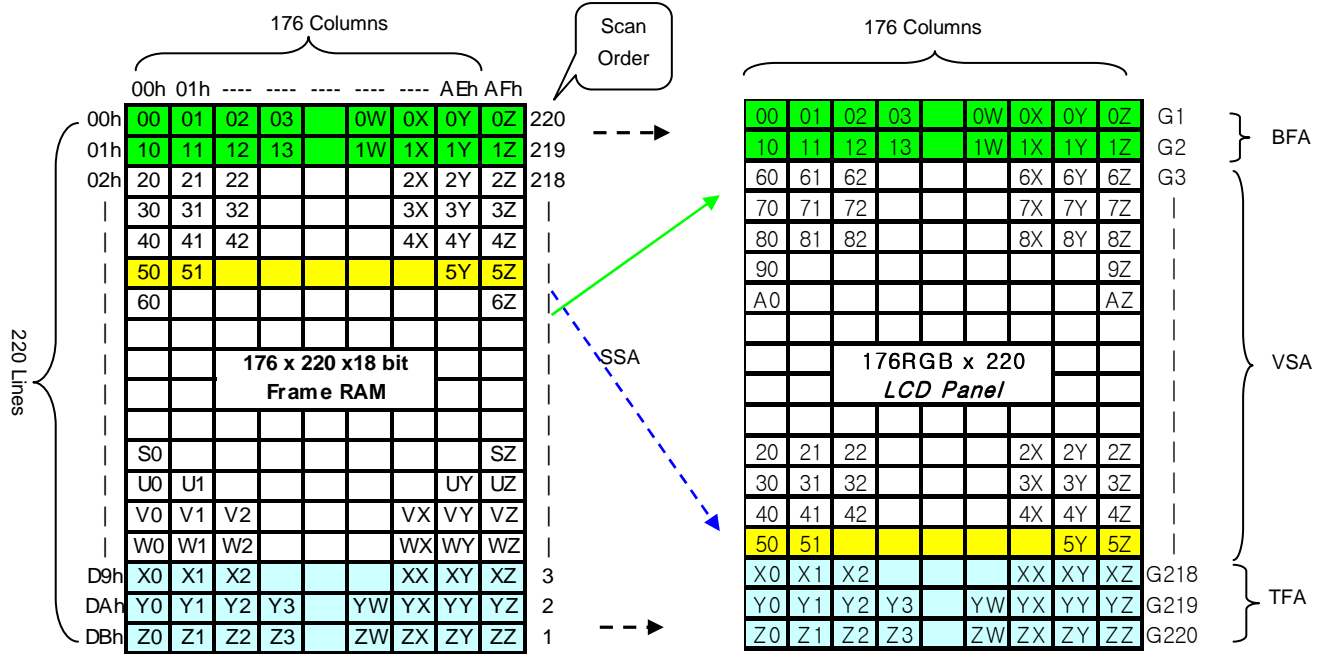

When Vertical Scrolling Definition Parameters (TFA+VSA+BFA)=220. In this case, scrolling is applied as shown below.

1). Example for TFA =3, VSA=215, BFA=2, SSA=4, ML=0: Scrolling

ST7773

2). Example for TFA=3, VSA=215, BFA=2, SSA=215, ML=1: Scrolling: TFA and BFT are exchanged

ST7773

9.9.5 Vertical Scroll Example

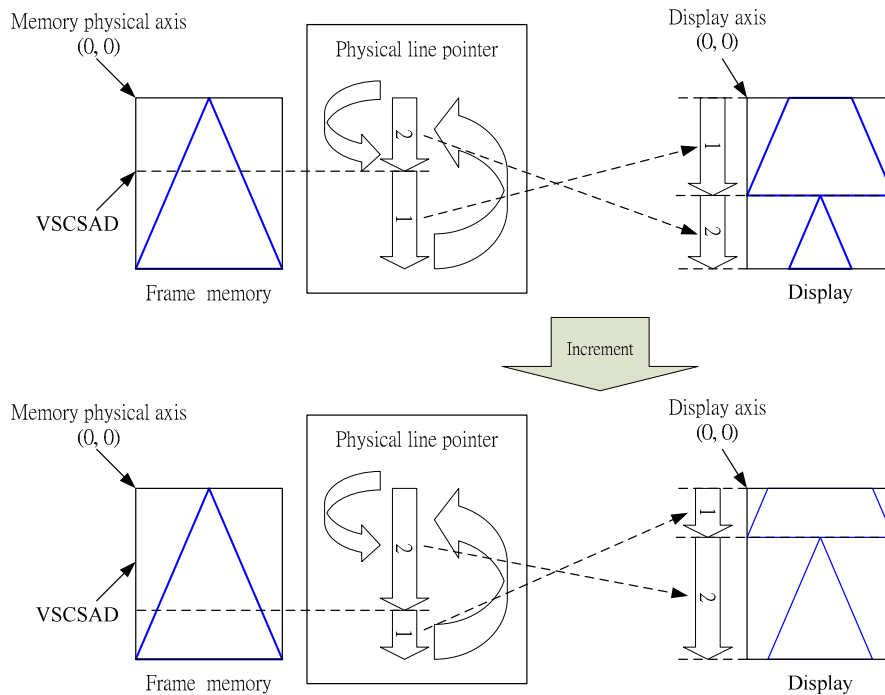

There are 2 types of vertical scrolling, which are determined by the commands “Vertical Scrolling Definition” (33h) and “Vertical Scrolling Start Address” (37h).

Case 1: TFA + VSA + BFA≠220

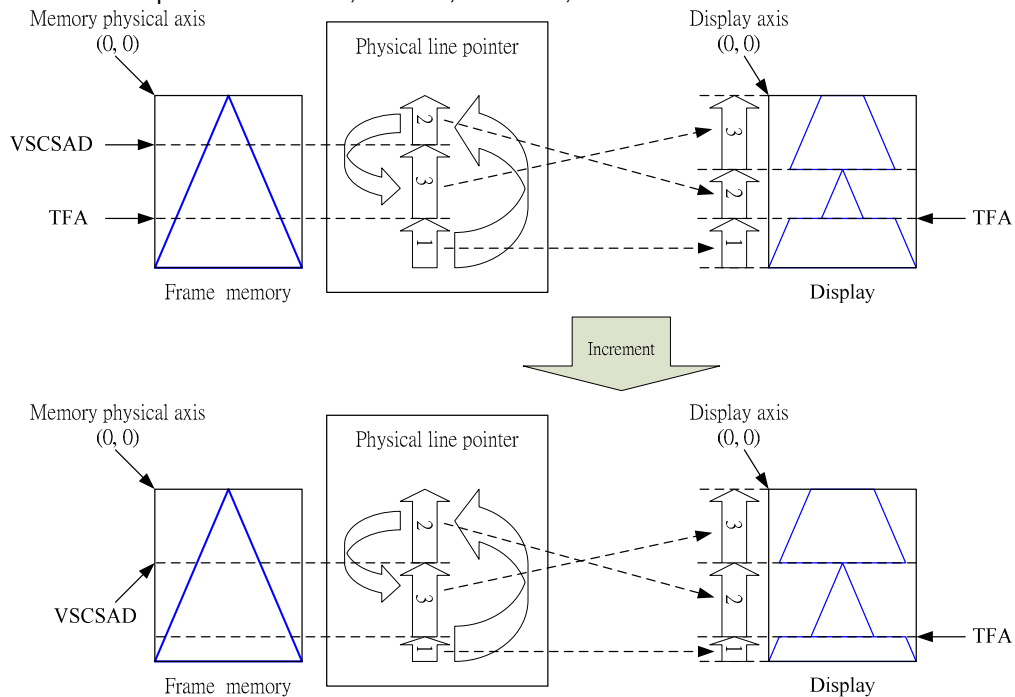

N/A. Do not set TFA + VSA + BFA≠220. In that case, unexpected picture will be shown.

Case 2: TFA + VSA + BFA=220 (Scrolling)

Example1) When MADCTL parameter ML=“0”, TFA=0, VSA=220, BFA=0 and VSCSAD=80.

Example2) When MADCTL parameter ML=“1”, TFA=30, VSA=190, BFA=0 and VSCSAD=80.

ST7773

9.10 Address Counter

The address counter sets the addresses of the display data RAM for writing and reading.

Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected (RGB 6-6-6-bit), according to the data formats. As soon as this pixel-data information is complete the "Write access" is activated on the RAM. The locations of RAM are addressed by the address pointers. The address ranges are X=0 to X=175 (AFh) and Y=0 to Y=219 (DBh). Addresses outside these ranges are not allowed. Before writing to the RAM, a window must be defined that will be written. The window is programmable via the command registers XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0 (0h) YS=0 (0h) and XE=175(AFh), YE=219 (DBh).

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address (X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS).

For flexibility in handling a wide variety of display architectures, the commands "CASET, RASET" and "MADCTL" (see section 10 command list), define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Section 9.12 show the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data must be rewritten to the display RAM.

For each image condition, the controls for the column and row counters apply as section 9.11 below:

Condition	Column Counter	Row Counter
When RAMWR/RAMRD command is accepted	Return to "Start Column (XS)"	Return to "Start Row (YS)"
Complete Pixel Read / Write action	Increment by 1	No change
The Column counter value is larger than "End Column (XE)"	Return to "Start Column (XS)"	Increment by 1
The Column counter value is larger than "End Column (XE)" and the Row counter value is larger than "End Row (YE)"	Return to "Start Column (XS)"	Return to "Start Row (YS)"

ST7773

9.11. Memory Data Write/ Read Direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by "Memory Data Access Control" Command, bits B5 (MV), B6 (MX), B7 (MY) as described below.

Fig. 9.11.1 Data streaming order

MV	MX	MY	CASET	RASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Row Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (219-Physical Row Pointer)
0	1	0	Direct to (175-Physical Column Pointer)	Direct to Physical Row Pointer
0	1	1	Direct to (175-Physical Column Pointer)	Direct to (219-Physical Row Pointer)
1	0	0	Direct to Physical Row Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (219-Physical Row Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Row Pointer	Direct to (175-Physical Column Pointer)
1	1	1	Direct to (219-Physical Row Pointer)	Direct to (175-Physical Column Pointer)

Note: Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7 (MY), B6 (MX), B5 (MV). The write order for each pixel unit is

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0

One pixel unit represents 1 column and 1page counter value on the Frame Memory.

ST7773

9.11.2 Frame Data Write Direction According to the MADCTL parameters (MV, MX and MY)

Display Data Direction	MADCTL Parameter			Image in the Host (MPU)	Image in the Driver (DDRAM)	
	MV	MX	MY			
Normal	0	0	0		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: CASET</div> <div>Y: RASET</div> </div>	
Y-Mirror	0	0	1		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: CASET</div> <div>Y: RASET</div> </div>	
X-Mirror	0	1	0		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: CASET</div> <div>Y: RASET</div> </div>	
X-Mirror Y-Mirror	0	1	1		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: CASET</div> <div>Y: RASET</div> </div>	
X-Y Exchange	1	0	0		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: RASET</div> <div>Y: CASET</div> </div>	
X-Y Exchange Y-Mirror	1	0	1		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: RASET</div> <div>Y: CASET</div> </div>	
X-Y Exchange X-Mirror	1	1	0		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: RASET</div> <div>Y: CASET</div> </div>	
X-Y Exchange X-Mirror Y-Mirror	1	1	1		<div> <div>H/W position (0,0) →</div> <div>X-Y address (0,0)</div> <div>X: RASET</div> <div>Y: CASET</div> </div>	

ST7773

9.12 Tearing Effect Output Line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

9.12.1 Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

thdh= The LCD display is not updated from the Frame Memory

thdl= The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 220 H-sync pulses per field.

thdh= The LCD display is not updated from the Frame Memory

thdl= The LCD display is updated from the Frame Memory (except Invisible Line – see above)

Note: During Sleep In Mode, the Tearing Output Pin is active Low.

ST7773

9.12.2 Tearing Effect Line Timings

The Tearing Effect signal is described below:

Table 9.12.1 AC characteristics of Tearing Effect Signal Idle Mode Off (Frame Rate = 58.9 Hz)

Symbol	Parameter	min	max	unit	description
t_{vdl}	Vertical Timing Low Duration	13	-	ms	
t_{vdh}	Vertical Timing High Duration	1000	-	μ s	
t_{hdl}	Horizontal Timing Low Duration	33	-	μ s	
t_{hdh}	Horizontal Timing Low Duration	25	500	μ s	

NOTE: The timings in Table 9.3.1 apply when MADCTL ML=0 and ML=1

The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

ST7773

9.12.3 Example 1: MPU Write is faster than panel read

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

ST7773

9.12.4 Example 2: MPU write is slower than panel read.

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MPU to Frame memory write position.

ST7773

9.13 Preset Values

ST7773 will set preset values on our production line for each display module. Any of these preset values do not need customer's SW support.

9.14 Power ON/OFF Sequence

The power on/off sequence is illustrated below: (VDD must be powered on then VDDI)

9.15.3 Uncontrolled Power Off

The uncontrolled power-off means a situation which removed a battery without the controlled power off sequence. It will neither damage the module or the host interface

If uncontrolled power-off happened, the display will go blank and there will not be any visible effects on the display (blank display) and remains blank until "Power On Sequence" powers it up.

ST7773

9.16 Power Level Definition

9.16.1 Power Level

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

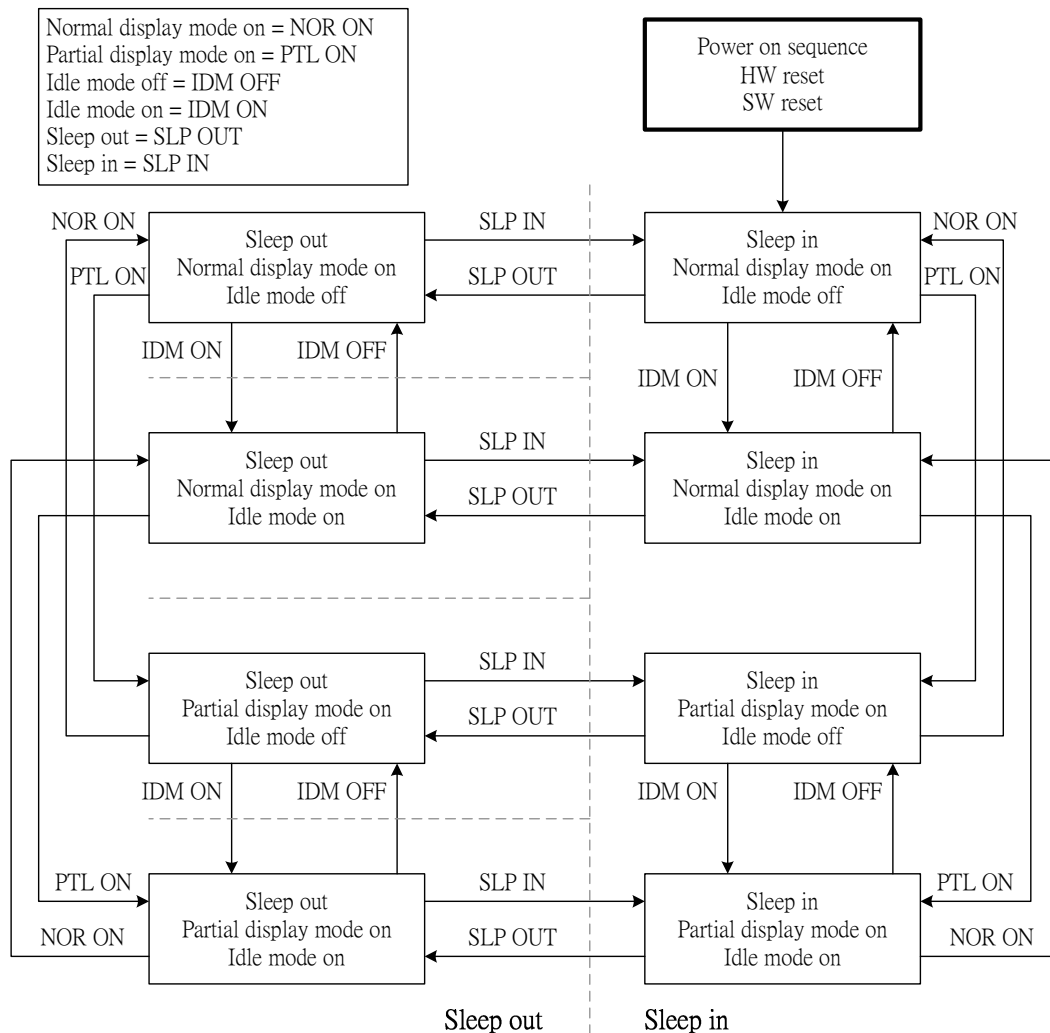

5. Sleep In Mode

In this mode, the DC: DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

6. Power Off Mode

In this mode, both VDD and VDDI are removed.

9.16.2 Power Flow Chart

ST7773

9.17 Reset Table

Item	After Power On	After Hardware Reset	After Software Reset
Frame memory	Random	No Change	No Change
Sleep In/Out	In	In	In
Display On/Off	Off	Off	Off
Display mode (normal/partial)	Normal	Normal	Normal
Display Inversion On/Off	Off	Off	Off
Display Idle Mode On/Off	Off	Off	Off
Column: Start Address (XS)	0000h	0000h	0000h
Column: End Address (XE)	00AFh	00AFh	00AFh (175d) (when MV=0) 00DBh (219d) (when MV=1)
Row: Start Address (YS)	0000h	0000h	0000h
Row: End Address (YE)	00DBh	00DBh	00DBh (219d) (when MV=0) 00AFh (175d) (when MV=1)
Gamma setting	GC0	GC0	GC0
RGB for 256, 4k and 65k Color Mode	See Section 9.19	See Section 9.19	No Change
Partial: Start Address (PSL)	0000h	0000h	0000h
Partial: End Address (PEL)	00DBh	00DBh	00DBh
Scroll: Vertical scrolling	Off	Off	Off
Scroll: Top Fixed Area (TFA)	0000h	0000h	0000h
Scroll: Scroll Area (VSA)	00DCh	00DCh	00DCh
Scroll: Bottom Fixed Area (BFA)	0000h	0000h	0000h
Scroll Start Address (SSA)	0000h	0000h	0000h
Tearing: On/Off	Off	Off	Off
Tearing Effect Mode *3)	0 (Mode1)	0 (Mode1)	0 (Mode1)
Memory Data Access Control (MY/MX/MV/ML/RGB)	0/0/0/0/0	0/0/0/0/0	No Change
Interface Pixel Color Format	6 (18-Bit/Pixel)	6 (18-Bit/Pixel)	No Change
RDDPM	08h	08h	08h
RDDMADCTL	00h	00h	No Change
RDDCOLMOD	6 (18-Bit/Pixel)	6 (18-Bit/Pixel)	No Change
RDDIM	00h	00h	00h
RDDSM	00h	00h	00h
RDDSDR	00h	00h	00h
ID1	29h	29h	29h
ID2	-	-	-

Note1. TE Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

9.18.1 Module Input/Output Pins

9.18.1.1 Output or Bi-directional (I/O) Pins

Output or Bi-directional pins	After Power On	After Hardware Reset	After Software Reset
TE	Low	Low	Low
D17 to D0 (Output driver)	High-Z (Inactive)	High-Z (Inactive)	High-Z (Inactive)

Note: There will be no output from D7-D0 during Power On/Off sequence, Hardware Reset and Software Reset.

9.18.1.2 Input Pins

Input pins	During Power On Process	After Power On	After Hardware Reset	After Software Reset	During Power Off Process
RESX	See 9.15	Input valid	Input valid	Input valid	See 9.15
CSX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D/CX	Input invalid	Input valid	Input valid	Input valid	Input invalid
WRX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RDX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D17 to D0	Input invalid	Input valid	Input valid	Input valid	Input invalid
P/SX	Input invalid	Input valid	Input valid	Input valid	Input invalid

ST7773

9.18.2 Reset Timing

VSS=0V, VDDI=1.6 to 3.3V, VDD=2.7 to 3.3V, Ta = 25°C)

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
t_{RESW}	*1) Reset low pulse width	RESX	10	-	-	-	us
t_{REST}	Reset complete time	-	120	-	-		ms

Note 1 Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below.

Note 2. During Reset Complete Time, ID2 and VCOMOF value in EEPROM will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (t_{REST}) within 5ms after a rising edge of RESX.

Note 3. Spike Rejection also applies during a valid reset pulse as shown below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 10us	Reset
Between 5us and 10us	Reset starts (It depends on voltage and temperature condition.)

ST7773

9.19 External Light Source

The operation of the module can meet customer's Environmental reliability requirements.

9.20 Oscillator

The chip has on-chip oscillator that does not require external components. This oscillator output signal is used for system clock generation for internal display operation.

9.21 System Clock Generator

The timing generator produces the various signals to driver the internal circuitry. Internal chip operation is not affected by operations on the data bus.

9.22 Instruction Decoder and Register

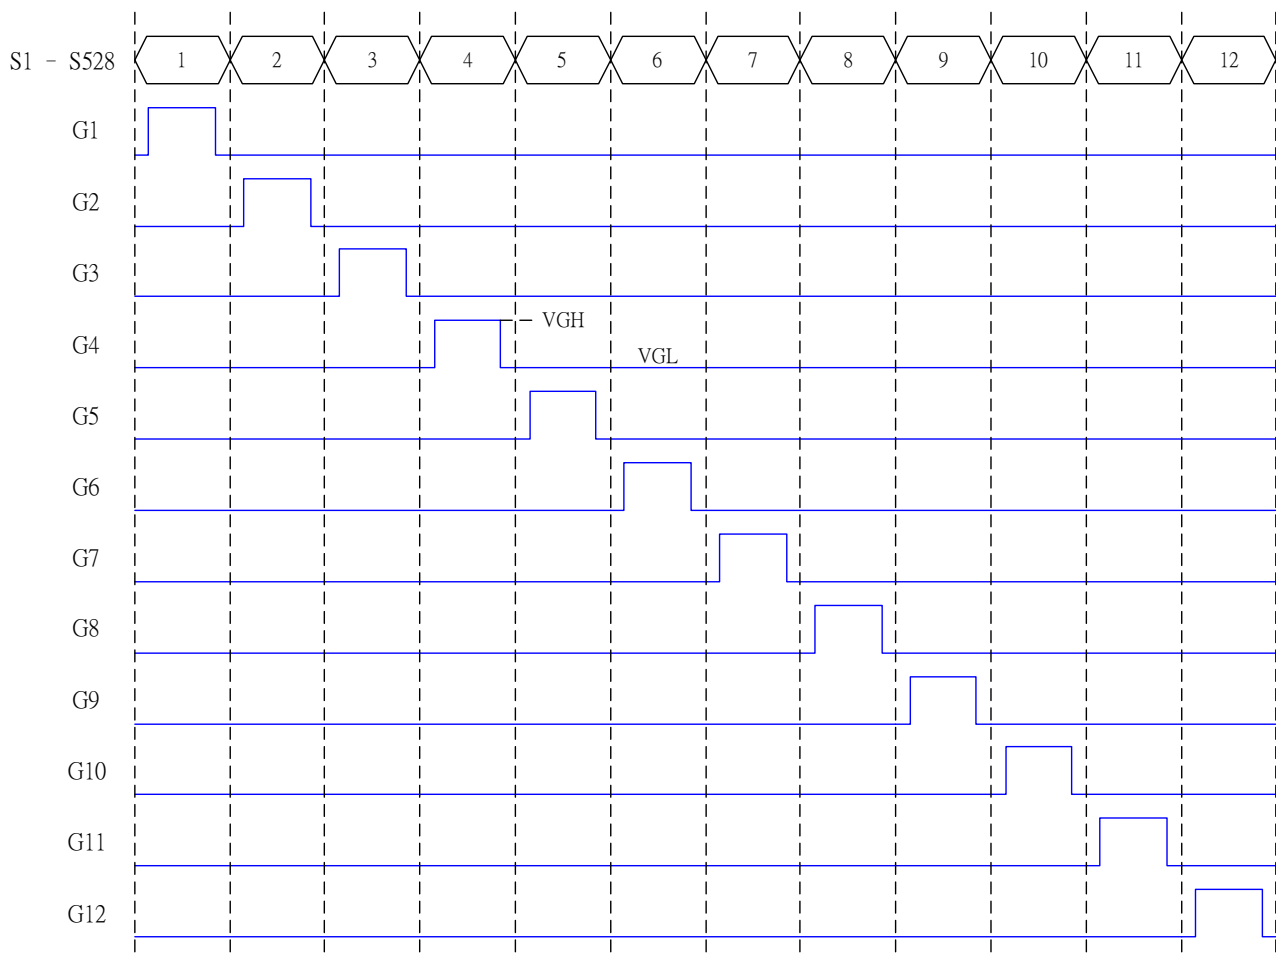

The instruction decoder identifies command words arriving at the interface and routes the following data bytes to their destination. The command set can be found in "Command" section.

9.23 Source Driver

The source driver block includes 176x3 source outputs (S1 to S528), which should be connected directly to the TFT-LCD. The source output signals are generated in the data processing block after the data is read out of the RAM and latched, which represent the simulatance selected rows.

9.24 Gate Driver

The gate driver block includes 220 channel gate output (G0 to G219) which should be connected directly to the TFT-LCD.

"-": Don't care

Note 1: After the H/W reset by RESX pin or S/W reset by SWRESET command, each internal register becomes default state (Refer "RESET TABLE" section)

Note 2: Undefined commands are treated as NOP (00 h) command.

Note 3: DE to FF are for factory use of driver supplier.

Note 4: Commands 10h, 12h, 13h, 20h, 21h, 26h, 28h, 29h, 30h, 33h, 36h (ML parameter only), 37h, 38h and 39h are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects. During Sleep In mode, these commands are updated immediately. Read status (09h), Read Display Power Mode (0Ah), Read Display MADCTL (0Bh), Read Display Pixel Format (0Ch), Read Display Image Mode (0Dh), Read Display Signal Mode (0Eh) of these commands are updated immediately both in Sleep In mode and Sleep Out mode.

10.1.26 MADCTL (36h): Memory Data Access Control

36H	MADCTL (Memory Data Access Control)												
Inst / Para	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Code)
MADCTL	0	↑	1	-	0	0	1	1	0	1	1	0	(36h)
1st Parameter	1	↑	1	-	MY	MX	MV	ML	RGB	MH	0	0	00h

NOTE: "-" Don't care, can be set to VDDI or DGND level

-This command defines read/ write scanning direction of frame memory.

-Bit Assignment

Bit	NAME	DESCRIPTION
MY	Row Address Order	These 3bits controls MCU to memory write/read direction. (See Section 9.12)
MX	Column Address Order	
MV	Row/Column Exchange	
ML	Vertical Refresh Order	LCD vertical refresh direction control '0' = LCD vertical refresh Top to Bottom '1' = LCD vertical refresh Bottom to Top
RGB	RGB-BGR ORDER	Color selector switch control '0' =RGB color filter panel, '1' =BGR color filter panel)
MH	Horizontal Refresh Order	LCD horizontal refresh direction control '0' = LCD horizontal refresh Left to right '1' = LCD horizontal refresh right to left

Description

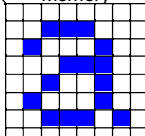

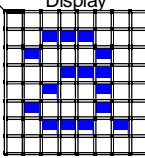

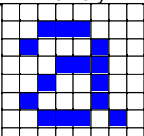

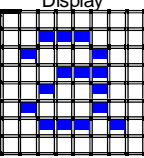

ML: Vertical Refresh Order

The diagram illustrates the ML: Vertical Refresh Order. It shows two scenarios: ML='0' (Top to Bottom) and ML='1' (Bottom to Top). In the ML='0' case, data is sent from Memory to Display in a top-to-bottom sequence (Sent First, Sent 2nd, Sent 3rd, ..., Sent Last). In the ML='1' case, data is sent from Memory to Display in a bottom-to-top sequence (Sent Last, ..., Sent 3rd, Sent 2nd, Sent First).

RGB: RGB-BGR Order

The diagram illustrates the RGB: RGB-BGR Order. It shows two scenarios: RGB='0' (RGB) and RGB='1' (BGR). In the RGB='0' case, the Driver IC sends signals SIG1, SIG2, ..., SIG176 to the LCD Panel, which displays RGB data. In the RGB='1' case, the Driver IC sends signals SIG1, SIG2, ..., SIG176 to the LCD Panel, which displays BGR data.

10.1.30 COLMOD (3Ah): Interface Pixel Format

3AH	COLMOD (3Ah): Interface Pixel Format												
Inst / Para	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Code)
COLMOD	0	↑	1	-	0	0	1	1	1	0	1	0	(3Ah)
1st Parameter	1	↑	1	-	0	1	1	0	0	IFPF2	IFPF1	IFPF0	66h

NOTE: "-" Don't care, can be set to VDDI or DGND level

Description	This command is used to define the format of RGB picture data, which is to be transferred via the MCU interface and RGB interface. The formats are shown in the table:		
	IFPF[2:0]		MCU Interface Color Format
	011	3	12-bit/pixel
	101	5	16-bit/pixel
	110	6	18-bit/pixel
	111	7	No used
Others are no define and invalid			
Note1: In 12-bit/Pixel, 16-bit/Pixel or 18-bit/Pixel mode, the LUT is applied to transfer data into the Frame Memory.			
Note 2: When VIPF[3:0]="1110",6-bit data width of 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.			
Default	Status		Default Value
			VIPF[3:0]
	Power On Sequence		06H(18-bit/Pixel)
	S/W Reset		No Change
	H/W Reset		06H(18-bit/Pixel)

NOTE: “-“ Don't care

-1st parameter: Set output waveform relation
-NO[1:0]: Set the amount of non-overlap of the gate output

NO[1:0]		Amount of non-overlap of the gate output	
		Refer the Internal oscillator	Refer the PCLK
00	0	No	4 clock cycle
01	1	1 clock cycle	16 clock cycle
10	2	4 clock cycle	24 clock cycle
11	3	6 clock cycle	32 clock cycle

-SDT[1:0]: Set delay amount from gate signal falling edge of the source output.

SDT[1:0]		Amount of non-overlap of the gate output	
		Refer the Internal oscillator	Refer the PCLK
00	0	No	4 clock cycle
01	1	1 clock cycle	8 clock cycle
10	2	2 clock cycle	12clock cycle
11	3	3 clock cycle	16 clock cycle

-EQ[1:0]: Set the Equalizing period

EQ[1:0]		Amount of non-overlap of the gate output	
		Refer the Internal oscillator	Refer the PCLK
00	0	No EQ	No EQ
01	1	2 clock cycle	4 clock cycle
10	2	4 clock cycle	16 clock cycle
11	3	6 clock cycle	24 clock cycle

Description

The diagram shows four waveforms: Gn, Gn+1, Sn, and VCOM. Gn and Gn+1 are gate signals that are high for a period and then low. The 'Gate Non-overlap period' is the time between the falling edge of Gn and the rising edge of Gn+1. Sn is the source output signal, which shows a delay time for source output after the gate signal falls. VCOM is the common voltage signal, which shows an EQ period (equalizing period) after the gate signal falls.

-2nd parameter: Set the output waveform in non-display area.
-PTG[1:0]: Determine gate output in a non-display area in the partial mode

PTG[1:0]		Gate output in a non-display area	
00	0	Normal scan	
01	1	Fix on VGL	
10	2	Fix on VGL	
11	3	Fix on VGL	

-PT[1:0]: Determine Source /VCOM output in a non-display area in the partial mode

PT[1:0]		Source output on non-display area		VCOM output on non-display area	
		Positive	Negative	Positive	Negative
00	0	V63	V0	VCOML	VCOMH
01	1	V0	V63	VCOML	VCOMH
10	2	AGND	AGND	AGND	AGND
11	3	Hi-z	Hi-z	AGND	AGND

11. Power structure

11.1. Driver IC Operating voltages Specification

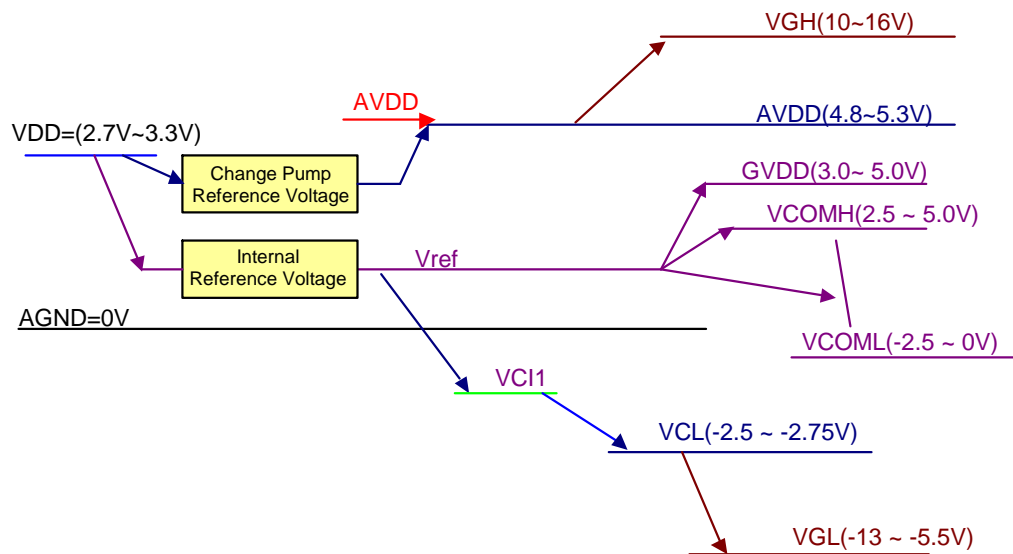

Fig 11.1.1 Power Booster Level

Remark

1. AVDD supply to all power source (exclude VGH, VGL)
2. Linear Range: 0.2V ~ AVDD-0.1V (For all output voltage, but exclude VGH, VGL)
3. Above operating voltages is min range.

11.2 Power Step1/2/4 Circuit

11.2.1 VCI1 generate from Vref

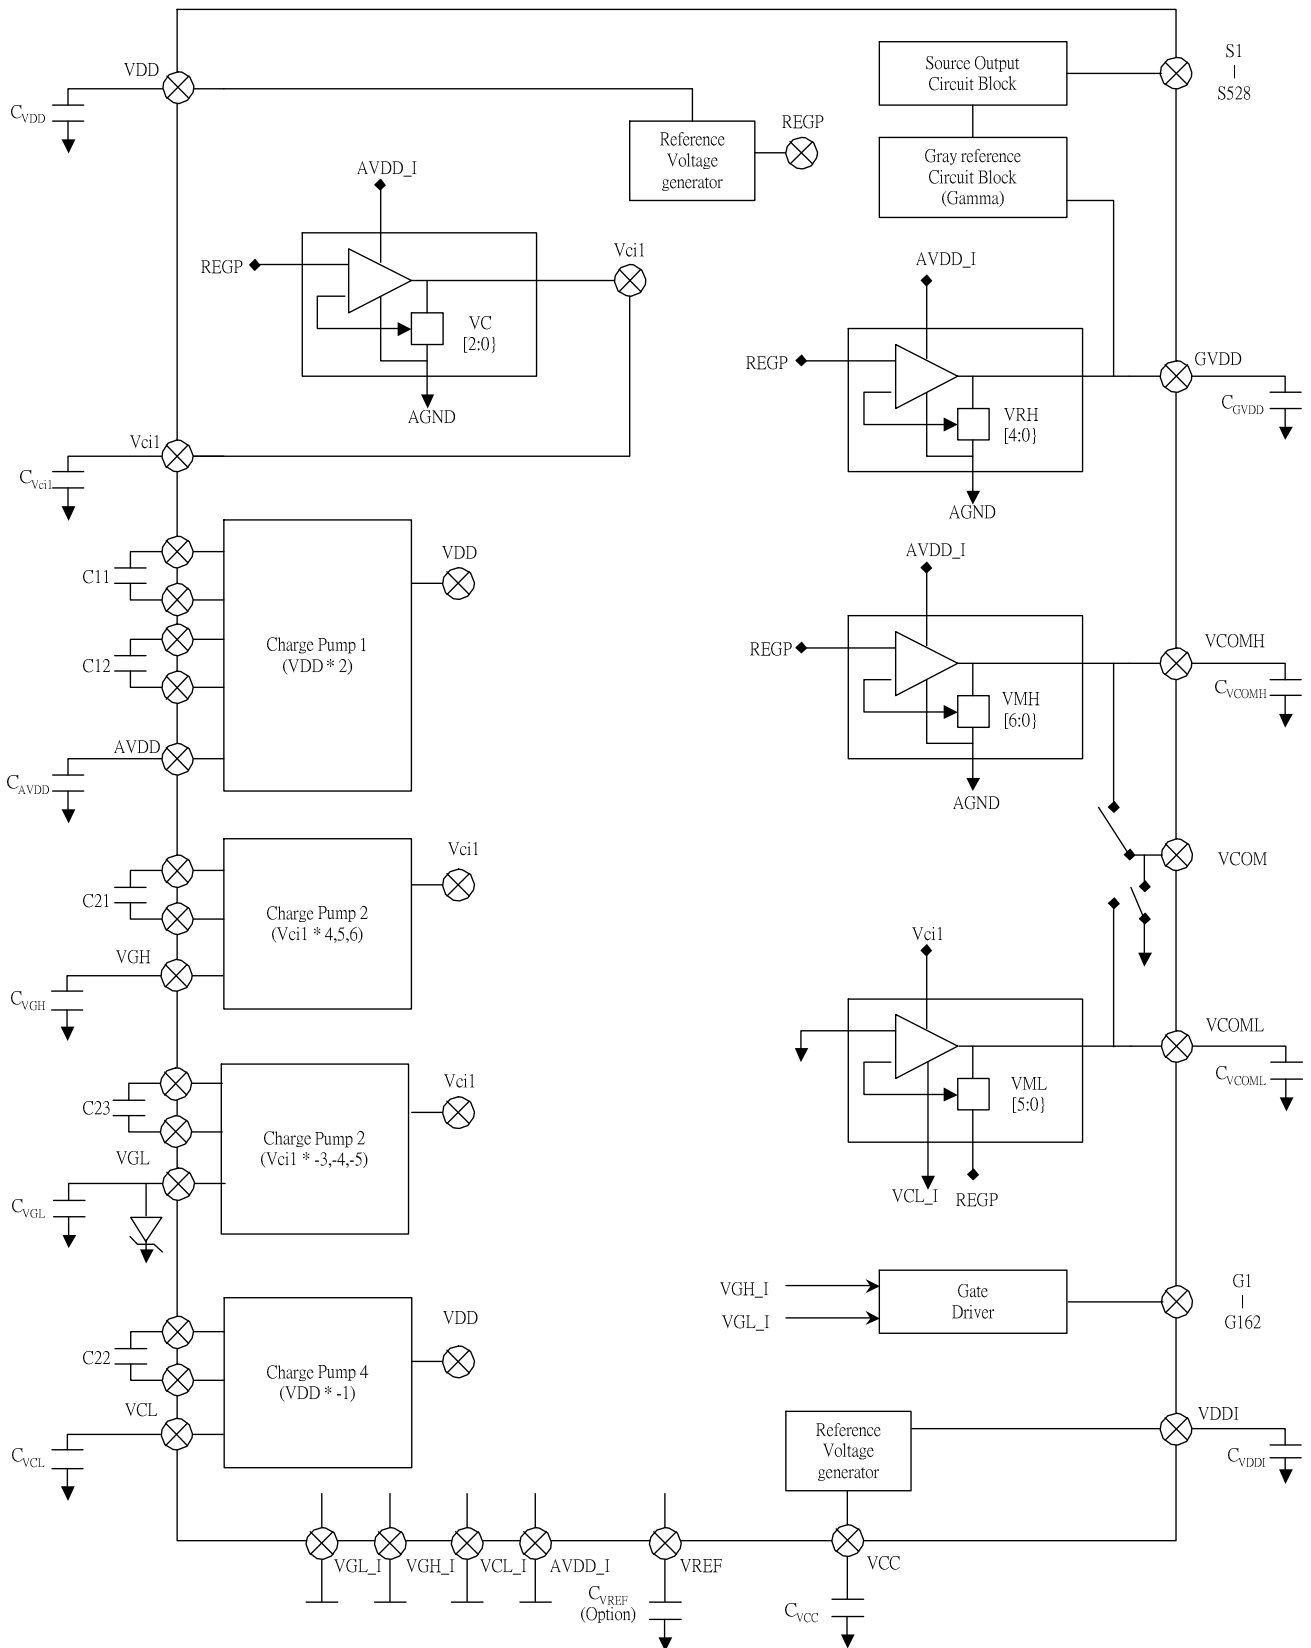

Fig. 11.2.1 Power Booster Structure (1)

ST7773

11.2.2 EXTERNAL COMPONENTS CONNECTION

Pad Name	Connection	Rated (Min) Voltage	Typical capacitance value
VDDI	VDDI (Logic Power)	6.3V	1.0 uF
VDD	VDD (Analog Power)	6.3V	1.0 uF
VCC	Connect to Capacitor (Max 3V): VCC ----- ----- GND	6.3V	1.0 uF
AGND	Analog ground (Connect to GND)		
DGND	Digital ground (Connect to GND)		
C23P, C23N	Connect to Capacitor: C23P ----- -----C23N	16.0V	1.0 uF
C22P, C22N	Connect to Capacitor: C22P ----- -----C22N	25.0V	1.0 uF
C21P, C22N	Connect to Capacitor: C21P ----- -----C21N	6.3V	1.0 uF
C12P, C12N	Connect to Capacitor: C12P ----- -----C12N	6.3V	1.0 uF
C11P, C11N	Connect to Capacitor: C11P ----- -----C11N	6.3V	1.0 uF
AVDD	Connect to Capacitor: AVDD ----- ----- GND	6.3V	1.0 uF
VCI1	Connect to Capacitor: AVDD ----- ----- GND	6.3V	1.0 uF
VGH	Connect to Capacitor: VGH ----- ----- GND	25.0V	1.0 uF
VGL	Connect to Capacitor: VGL ----- ----- GND	16.0V	1.0 uF
VCL	Connect to Capacitor: VCL ----- ----- GND	6.3V	1.0 uF
VREF	Connect to Capacitor: VREF ----- ----- GND(Optional)	6.3V	1.0 uF
GVDD	Connect to Capacitor: GVDD ----- ----- GND(Optional)	6.3V	1.0 uF
VCOMH	Connect to Capacitor: VCOMH----- ----- GND	6.3V	1.0 uF
VCOML	Connect to Capacitor: VCOML ----- ----- GND	6.3V	1.0 uF
VGL	Connect to Schottky diode: VGL -----> ----- GND	30V	Schottky diode(note1)

Note1: Leakage current must to be smaller than 20uA when the schottky diode operates at -30~85°C .

ST7773

12. Gamma structure

12.1 STRUCTURE OF GRAYSCALE AMPLIFIER

The structure of grayscale amplifier is shown as below. 16 voltage levels (VIN0-VIN15) between GVDD and VGS are determined by the high/ mid/ low level adjustment registers. Each mid-adjustment level is split into 64 levels again by the internal ladder resistor network. As a result, grayscale amplifier generates 64 voltage levels ranging from V0 to V63 and outputs one of 64 levels.

ST7773

12.2 ST7773 Gamma Voltage Formula (Positive/ Negative Polarity)

Grayscale	Voltage Formula(Positive)	Voltage Formula(Negative)
0	VINP0	VINN0
1	VINP1	VINN1
2	VINP2	VINN2
3	VINP3	VINN3
4	$V3-(V3-V6)*(11/30)$	$V3-(V3-V6)*(11/30)$
5	$V3-(V3-V6)*(21/30)$	$V3-(V3-V6)*(21/30)$
6	VINP4	VINN4
7	$V6-(V6-V11)*(7/30)$	$V6-(V6-V11)*(7/30)$
8	$V6-(V6-V11)*(14/30)$	$V6-(V6-V11)*(14/30)$
9	$V6-(V6-V11)*(20/30)$	$V6-(V6-V11)*(20/30)$
10	$V6-(V6-V11)*(25/30)$	$V6-(V6-V11)*(25/30)$
11	VINP5	VINN5
12	$V11-(V11-V19)*(4/32)$	$V11-(V11-V19)*(4/32)$
13	$V11-(V11-V19)*(8/32)$	$V11-(V11-V19)*(8/32)$
14	$V11-(V11-V19)*(12/32)$	$V11-(V11-V19)*(12/32)$
15	$V11-(V11-V19)*(16/32)$	$V11-(V11-V19)*(16/32)$
16	$V11-(V11-V19)*(20/32)$	$V11-(V11-V19)*(20/32)$
17	$V11-(V11-V19)*(24/32)$	$V11-(V11-V19)*(24/32)$
18	$V11-(V11-V19)*(28/32)$	$V11-(V11-V19)*(28/32)$
19	VINP6	VINN6
20	$V19-(V19-V27)*(4/32)$	$V19-(V19-V27)*(4/32)$

13. Example Connection with Panel direction and Different Resolution

Case 1: (This is default case)

- 1st Pixel is at *Left Top* of the panel
- RGB filter order = **RGB**

- Direction default setting (H/W)

SMX = '0'
SMY = '0'
SRGB = '0'

S1 = Filter **R**

S2 = Filter **G**

S3 = Filter **B**

- Display direction control (S/W)

- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

Case 2:

- 1st Pixel is at *Left Top* of the panel
- RGB filter order = **BGR**

- Direction default setting (H/W)

SMX = '0'
SMY = '0'
SRGB = '1'

S1 = Filter **B**

S2 = Filter **G**

S3 = Filter **R**

- Display direction control (S/W)

- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

ST7773

Case 3:

- 1st Pixel is at *Right Bottom* of the panel
- RGB filter order = **RGB**

- Direction default setting (H/W)
 - SMX = '1'
 - SMY = '1'
 - SRGB = '0'
- S1 = Filter **R**
- S2 = Filter **G**
- S3 = Filter **B**
- Display direction control (S/W)
 - X-Mirror control by MX
 - Y-Mirror control by MY
 - XY-Exchange control by MV

Case 4:

- 1st Pixel is at *Right Bottom* of the panel
- RGB filter order = **BGR**

- Direction default setting (H/W)
 - SMX = '1'
 - SMY = '1'
 - SRGB = '1'
- S1 = Filter **B**
- S2 = Filter **G**
- S3 = Filter **R**
- Display direction control (S/W)
 - X-Mirror control by MX
 - Y-Mirror control by MY
 - XY-Exchange control by MV
